Package 'Rseb'

January 6, 2021

Type Package

Title A package for NGS data managing and visualization
Version 0.1.1
Author Sebastian Gregoricchio
Maintainer Sebastian Gregoricchio <sebastian.gregoricchio@gmail.com></sebastian.gregoricchio@gmail.com>
Description
An R-package for daily tasks required to handle biological data as well as avoid recoding of small functions for quick but necessary data managing.
License GNU GENERAL PUBLIC LICENSE version 3
Depends
R, BiocManager, Biostrings, biomaRt, GO.db, rtracklayer, cowplot, data.table, dplyr, ggplot2, ggrepel, matrixStats, plyr, purrr, robustbase, stringr, tidyr, tools
$\operatorname{biocViews}$
Imports Biostrings, biomaRt, GO.db, rtracklayer, cowplot, data.table, dplyr, ggplot2, ggrepel, matrixStats, plyr, purrr, robustbase, stringr, tidyr, tools
Encoding UTF-8
LazyData true
RoxygenNote 7.1.1

calculate.mode

 $Mode\ calculation$

Description

Calculate the mode value of a vector of numeric values.

Usage

```
calculate.mode(v)
```

Arguments

٧

A vector of numeric numbers

Value

A single number corresponding to the mode of the list of numbers give as input

```
mode = calculate.mode(v = c(6, 8, 4, 845, 8, 5, 55, 84, 8, 84, 45, 5))
```

cmyk

cmyk

 $CMYK\ color\ converter$

Description

Converts CMYK color values to hexadecimal color values

Usage

```
cmyk(C, M, Y, K)
```

Arguments

С	Value in the 0-100 range for the Cyan component.
М	Value in the 0-100 range for the Magenta component.
Υ	Value in the 0-100 range for the Yellow component.
K	Value in the 0-100 range for the Key component.

Value

The result is a string for the color in hexadecimal scale, eg. "#FFFFFF".

Examples

```
color = cmyk(0, 0, 0, 0)
```

combine.lists

 $List\ combiner$

Description

Combines two or more lists in a single one keeping the element names.

Usage

```
combine.lists(list.of.lists)
```

Arguments

```
list.of.lists A list of lists.
```

Value

It returns a list that is a combination of the lists in the input list. If the list is not a nested list of list the original input is returned.

Examples

Description

This function runs a command line that uses deeptools to calculate scores per genome regions and to prepare an intermediate file that can be used with plot.density.profile. Typically, the genome regions are genes, but any other regions defined in a BED file can be used. computeMatrix accepts multiple score files (bigWig format) and multiple regions files (BED format). This tool can also be used to filter and sort regions according to their score.

```
computeMatrix.deeptools(
 mode,
  scoreFileName,
  regionsFileName,
 outFileName,
  outFileNameMatrix = NULL,
  outFileSortedRegions = NULL,
  referencePoint = "TSS",
  nanAfterEnd = FALSE,
  regionBodyLength = 1000,
  startLabel = "TSS",
  endLabel = "TES",
  unscaled5prime = 0,
  unscaled3prime = 0,
  upstream = 500,
  downstream = 500,
  binSize = 10,
  sortRegions = "keep",
  sortUsing = "mean",
  sortUsingSamples = NULL,
  averageTypeBins = "mean",
 missingDataAsZero = FALSE,
  skipZeros = FALSE,
 minThreshold = NULL,
 maxThreshold = NULL,
 blackListFileName = NULL,
```

```
samplesLabel = NULL,
smartLabels = TRUE,
scale = 1,
numberOfProcessors = "max",
metagene = FALSE,
transcriptID = "transcript",
exonID = "exon",
transcript_id_designator = "transcript_id",
srun = FALSE,
computeMatrix.deeptools.command = "computeMatrix",
return.command = FALSE,
run.command = TRUE,
quiet = FALSE,
verbose = FALSE
```

Arguments

mode

The type of matrix computation. Allowed values are "reference-point" or "scale-region". No default.

• reference-point:

Reference-point refers to a position within a BED region (e.g., the starting point). In this mode, only those genomic positions before (upstream) and/or after (downstream) of the reference point will be plotted;

• scale-region:

In the scale-regions mode, all regions in the BED file are stretched or shrunken to the length (in bases) indicated by the user.

scoreFileName

String vector with the full paths to bigWig file(s) containing the scores to be plotted.

regionsFileName

String vector with the full paths to .BED or .GTF files containing the regions to plot. If multiple bed files are given, each one is considered a group that can be plotted separately. Also, adding a "#" symbol in the bed file causes all the regions until the previous "#" to be considered one group.

outFileName

String containing the full file name to save the gzipped matrix file (.gz) needed by plot.density.profile.

outFileNameMatrix

If this option is given, then the matrix of values underlying the heatmap will be saved using the indicated name, e.g. IndividualValues.tab. This matrix can easily be loaded into R or other programs. By default NULL.

outFileSortedRegions

File name in which the regions are saved after skiping zeros or min/max threshold values. The order of the regions in the file follows the sorting order selected. This is useful, for example, to generate other heatmaps keeping the sorting of the first heatmap. Example: Heatmap1sortedRegions.bed. By default NULL.

referencePoint Possible choices: TSS, TES, center. The reference point for the plot-

ting could be either the region start (TSS), the region end (TES) or the center of the region. Note that regardless of what you specify, plotHeatmap/plotProfile will default to using "TSS" as the label. By default

TSS.

Logic value. If set (TRUE), any values after the region end are discarded. nanAfterEnd This is useful to visualize the region end when not using the scale-regions

mode and when the reference-point is set to the TSS. By default FALSE.

regionBodyLength

Distance in bases to which all regions will be fit. (Default: 1000).

startLabel Label shown in the plot for the start of the region. Default is TSS (transcription start site), but could be changed to anything, e.g. "peak start".

Note that this is only useful if you plan to plot the results yourself and not, for example, with plotHeatmap, which will override this. (Default:

"TSS").

endLabel Label shown in the plot for the region end. Default is TES (transcription end site). See the -startLabel option for more information. (Default:

"TES").

unscaled5prime Number of bases at the 5-prime end of the region to exclude from scaling.

By default, each region is scaled to a given length (see the -regionBodyLength option). In some cases it is useful to look at unscaled signals around region boundaries, so this setting specifies the number of unscaled bases on

the 5-prime end of each boundary. (Default: 0).

unscaled3prime Number of bases at the 3-prime end of the region to exclude from scaling.

By default, each region is scaled to a given length (see the -regionBodyLength option). In some cases it is useful to look at unscaled signals around region boundaries, so this setting specifies the number of unscaled bases on

the 3-prime end of each boundary. (Default: 0).

Distance upstream of the reference-point selected. (Default: 500). upstream

Distance downstream of the reference-point selected. (Default: 500). downstream

Length, in bases, of the non-overlapping bins for averaging the score over

the regions length. (Default: 10). Possible choices: "descend", "ascend", "no", "keep". Whether the output

> file should present the regions sorted. The default is to not sort the regions. Note that this is only useful if you plan to plot the results yourself and not, for example, with plotHeatmap, which will override this. Note also that unsorted output will be in whatever order the regions happen to be processed in and not match the order in the input files. If you require the output order to match that of the input regions, then either specify "keep" or use computeMatrixOperations to resort the results file.

(Default: "keep").

Possible choices: "mean", "median", "max", "min", "sum", "region_length". Indicate which method should be used for sorting. The value is computed for each row.Note that the region_length option will lead to a dotted

line within the heatmap that indicates the end of the regions. (Default:

"mean").

binSize

sortRegions

sortUsing

sortUsingSamples

List of sample numbers (order as in matrix), that are used for sorting by -sortUsing, no value uses all samples, example: -sortUsingSamples 1 3. By default NULL.

averageTypeBins

Possible choices: "mean", "median", "min", "max", "std", "sum". Define the type of statistic that should be used over the bin size range. (Default: "mean").

missingDataAsZero

Logic value to define if set, missing data (NAs) will be treated as zeros. The default is to ignore such cases (NULL). If not included, this parameter can be changed later in the function plot.density.profile.

Logic value to understand whether regions with only scores of zero should be included or not. Default is to include them (FALSE).

> Numeric value. Any region containing a value that is less than or equal to this will be skipped. This is useful to skip, for example, genes where the read count is zero for any of the bins. This could be the result of unmappable areas and can bias the overall results. (Default: NULL).

maxThreshold Numeric value. Any region containing a value greater than or equal to this will be skipped. The maxThreshold is useful to skip those few regions with very high read counts (e.g. micro satellites) that may bias the average values. (Default: NULL).

blackListFileName

A BED file containing regions that should be excluded from all analyses. Currently this works by rejecting genomic chunks that happen to overlap an entry. Consequently, for BAM files, if a read partially overlaps a blacklisted region or a fragment spans over it, then the read/fragment might still be considered. (Default: NULL).

Labels for the samples. This will then be passed to plot.density.profile function. The default is to use the file name of the sample. The sample labels should be separated by spaces and quoted if a label itself contains a space E.g. -samplesLabel label-1 "label 2".

Instead of manually specifying labels for the input bigWig and BED/GTF files, this causes deepTools to use the file name after removing the path and extension. (Default: TRUE).

If set, all values are multiplied by this number. (Default: 1).

numberOfProcessors

Number of processors to use. Type "max/2" to use half the maximum number of processors or "max" to use all available processors. (Default: "max").

When either a BED12 or GTF file are used to provide regions, perform the computation on the merged exons, rather than using the genomic interval defined by the 5-prime and 3-prime most transcript bound (i.e., columns 2 and 3 of a BED file). If a BED3 or BED6 file is used as input, then columns 2 and 3 are used as an exon. (Default: FALSE).

skipZeros

minThreshold

samplesLabel

scale

smartLabels

metagene

transcriptID When a GTF file is used to provide regions, only entries with this value

as their feature (column 3) will be processed as transcripts. (Default:

"transcript").

exonID When a GTF file is used to provide regions, only entries with this value

as their feature (column 3) will be processed as exons. CDS would be

another common value for this. (Default: "exon").

transcript_id_designator

Each region has an ID (e.g., ACTB) assigned to it, which for BED files is either column 4 (if it exists) or the interval bounds. For GTF files this is instead stored in the last column as a key:value pair (e.g., as 'transcript_id "ACTB"', for a key of transcript_id and a value of ACTB). In some cases it can be convenient to use a different identifier. To do so, set this to the

desired key. (Default: "transcript_id").

srun Logic value to define whether the command should be run in srun mode.

By default FALSE.

computeMatrix.deeptools.command

String to define the command to use to recall the compute Matrix function of deeptools. An example: "/home/user/anaconda3/bin/compute Matrix".

By default "computeMatrix".

return.command Logic value to define whether to return the string corresponding to the

command for deeptools. By default FALSE.

run.command Logic value to define whether to run the the command line on system

terminal and generate the score matrix by deeptools. By default TRUE.

quiet Logic value to define if to remove any warning or processing messages.

By default FALSE.

verbose Logic value to define if to be VERY verbose in the status messages. -quiet

will disable this. By default FALSE.

Details

To know more about the deeptools's computeMatrix function see the package manual at the following link:

https://deeptools.readthedocs.io/en/develop/content/tools/computeMatrix.html.

Value

The function generates the files indicated by the output parameters. The matrix.gz output file can be read by the function read.computeMatrix.file.

```
computeMatrix.deeptools(
   mode = "reference-point",
   scoreFileName = c("path_to/signal_file1.bw", "path_to/signal_file2.bw"),
   regionsFileName = c("path.to/regions1.bed", "path.to/regions2.bed"),
   upstream = 1000,
   downstream = 1000,
   outFileName = "path_to/output_matrix.gz",
```

convert_sequence 9

```
computeMatrix.deeptools.command = "/home/user/anaconda3/bin/computeMatrix",
    referencePoint = "peakMax")

computeMatrix.deeptools(
    mode = "scale-regions",
    scoreFileName = c("path_to/signal_file1.bw", "path_to/signal_file2.bw"),
    regionsFileName = c("path.to/regions1.bed", "path.to/regions2.bed"),
    upstream = 1000,
    downstream = 1000,
    regionBodyLength = 300,
    startLabel = "geneStart",
    endLabel = "geneEnd",
    outFileName = "path_to/output_matrix.gz",
    computeMatrix.deeptools.command = "/home/user/anaconda3/bin/computeMatrix",
    referencePoint = "peakMax")
```

 $convert_sequence$

Nucleic acid sequences converter.

Description

Obtains de complementary, reverse complementary or the reverse of a DNA/RNA sequence.

Usage

```
convert_sequence(sequence = NULL, mode = "not specified", nucleic.acid = "DNA")
```

Arguments

sequence A string containing the sequence to be converted. By default NULL, it

returns an help for the mode.

mode A string value to define the modality of convertion. Possible options:

- Reverse complement = revComp — RC — rc — reverseComplement

- Reverse = rev - R - r - reverse

- Complement = comp - C - c — complement.

By default "not specified", it returns an help for the mode.

nucleic.acid A string to define the type of nucleic acid to which the input sequence

belongs. Available options "DNA", default value, or "RNA".

Value

It returns a string with the converted sequence.

10 data.summary

Examples

data.frame.to.list

Data frame conversion to a list of columns.

Description

Converts each column of a data frame in a element of a list with the corresponding name of the original column. Useful for further use in functions such as purrr::pmap().

Usage

```
data.frame.to.list(x)
```

Arguments

Χ

A data.frame to be converted

Value

A list of vectors in which each element is a column of input the data.frame.

Examples

```
data.frame.to.list(mtcars)
```

data.summary

Statistical data summary generator

Description

Produces a table with a summary of the statistics for a specific column of an input data.frame by a group of values defined by a group defined by another column.

Usage

```
data.summary(data, variable, group.names)
```

Arguments

data Input data.frame to be analyzed.

variable A string with the name of the column to be analyzed.

group.names A string with the name of the column indicating the groups.

DE.status 11

Value

It returns a list that is a combination of the lists in the input list. If the list is not a nested list of list the original input is returned.

Examples

```
data.summary(data = mtcars, variable = "mpg", group.names = "disp")
```

DE.status

Differential Expression status calculator for RNA-seq data

Description

Defines the differential expression status of genes from RNA-seq data depending on fold change expression and adjusted p-value.

Usage

```
DE.status(
  log2FC,
  p.value.adjusted,
  FC_threshold = 1.5,
  FC_NoResp_left = 0.9,
  FC_NoResp_rigth = NULL,
  p.value_threshold = 0.05,
  low.FC.status.label = "DOWN",
  high.FC.status.label = "UP",
  unresponsive.label = "NoResp",
  null.label = "NULL"
)
```

Arguments

log2FC Numeric vector of log2(fold change expression) values.

p.value.adjusted

Numeric vector of p-values. Use of adjusted p-values is recommended.

FC_threshold Value of the threshold to use for the fold change expression to define differentially expressed genes, expressed as linear value. By default 1.5

and by consequence 1/1.5.

FC_NoResp_left Value of the threshold to use for the fold change expression to define unresponsive genes when FC < 1, expressed as linear value. By default 0.9. If NULL it will be calculated symmetrically from FC_NoResp_rigth as

1/FC_NoResp_rigth.

12 density_plot

FC_NoResp_rigth Value of the threshold to use for the fold change expression to define unresponsive genes when FC > 1, expressed as linear value. By default 1.1. If NULL it will be calculated symmetrically from FC_NoResp_left as 1/FC_NoResp_left.

p.value_threshold

Value of the threshold to use for the p-values to define differentially expressed genes, expressed as linear value. By default 0.05.

low.FC.status.label

String to define the label indicating the differentially expressed genes with a FoldChange < FC_threshold.

high.FC.status.label

String to define the label indicating the differentially expressed genes with a FoldChange > FC_threshold.

unresponsive.label

String to define the label indicating the unresponsive genes identified as FC_NoResp_left < FoldChange < FC_NoResp_rigth and p.value > p.value.threshold.

null.label String to define the label indicating the null genes.

Value

It returns a vector containing the differential expression status for each original value in the same order used in the input.

density_plot

Plot density signal of NGS data.

Description

Plots the density profile of NGS data (e.g. ChIP-seq, ATAC-seq, MeDIP-seq, etc.). Used by the function plot.density.profile.

```
density_plot(
   samples,
   scores,
   positions,
   variance_scores,
   xlab = "Distance from regions center [bp]",
   ylab = "Average density signal",
   line_type = "solid",
   y_lim = NULL,
   x_lim = NULL,
   x_intercept = 0,
   colors = c("blue", "red", "purple", "orange", "green"),
   title = "Density profile",
```

density_plot 13

```
text_size = 12,
variance = T,
print_plot = F,
line_width = 1,
variance_opacity = 0.25
)
```

Arguments

samples A character vector containing the samples list.

scores A numeric vector containing the scores for the Y-axis.

Positions A numeric vector containing the position for the X-axis.

variance_scores

A numeric vector containing the variance/error value at each position.

xlab A string containing the label for the X-axis. By default "Distance from

regions center [bp]".

ylab A string containing the label for the Y-axis. By default "Average density

signal".

line_type Vector to define each line type. Both numeric and string codes are ac-

cepted. if only one element is given this will be applied to all the lines.

By default "solid".

Example 1: c("solid", "dashed").

Example 2: c(1,2)

y_lim List of numeric vectors with two elements each to define the range of the

Y-axis. To set only one side use NA for the side to leave automatic. If only one range is given this one will be applied to all the plots. By default

NULL, the range will be defined automatically.

Example list(c(0,20), c(NA,30), c(0,NA), c(NA,NA)).

x_lim List of numeric vectors with two elements each to define the range of the

X-axis. To set only one side use NA for the side to leave automatic. If only one range is given this one will be applied to all the plots. By default

NULL, the range will be defined automatically.

Example list(c(0,20), c(NA,30), c(0,NA), c(NA,NA)).

x_intercept A vector indicating the X intercepts for the vertical lines. By default 0.

colors Vector to define the line and error area colors. If only one value is provided

or the number of values is lower than the required ones only the first value will be used. All standard R.colors values are accepted. By default

c("blue", "red", "purple", "orange", "green").

title A string containing the label for the X-axis. By default "Density profile".

text_size Numeric value to define the size of the text for the labels of all the plots.

By default 12.

variance Logic value to define whether to plot the error/variance around the signal.

By default TRUE.

print_plot Logic value to define whether to print the plot once generated or not. By

default FALSE.

14 doughnut

line_width Numeric value to define the line width for all the plots. By default 1., variance_opacity

Numeric value to define the alpha/transparency of the error/variance. By default 0.25. Parameter considered only when variance = TRUE).

Value

Returns a plot in ggplot2 format.

doughnut

 $Donut/Doughnut\ plot$

Description

Generation of a donut/doughnut plot (equivalent of a pie chart)

Usage

```
doughnut(
    x,
    labels = as.character(x),
    edges = 200,
    outer.radius = 0.8,
    inner.radius = 0.4,
    clockwise = FALSE,
    init.angle = if (clockwise) 90 else 0,
    density = NULL,
    angle = 45,
    col = NULL,
    border = FALSE,
    lty = NULL,
    main = NULL,
    ...
)
```

Arguments

X	A vector containing the values to be plotted.
labels	A string vector for the labels of the different sectors. By default as $character(x)$.
edges	Number of edges of the shape. By default 200.
outer.radius	Fraction of the area to dedicate to the outer circle. By default 0.8.
inner.radius	Fraction of the area to dedicate to the inner circle. By default 0.4.
clockwise	Logic value to define whether the values should be plotted in clockwise sense. By default FALSE.
init.angle	Numeric value to define the starting angle for the data. By default if clockwise = TRUE 90, otherwise 0.

15 get.gene.name

density	A vector or single number to define de density of the lines in the filling color of each value plotted. By default NULL.
angle	A vector or single number to define de angle of the lines in the filling color of each value plotted. By default 45 .
col	A vector of R standard colors for each value to be plotted. By default \ensuremath{NULL} .
border	Logic value to define whether plot the border of the sectors. By default $FALSE.$
lty	Numeric value to define the type of line for the borders. By default \ensuremath{NULL} .
main	String to set the title of the plot. By default NULL.

References

```
https://magesblog.com/
```

Examples

```
doughnut(x = c(3,5,9,12), inner.radius=0.5, col=c("red", "blue", "green", "yellow"))
```

get.gene.name	Conversion of ENSEMBL gene IDs.

Description

Conversion of ENSEMBL gene IDs to gene symbols.

Usage

```
get.gene.name(ensembl.id, type = "gene", organism = "mmusculus")
```

Arguments

ensembl.id String vector of ENSEMBL genes IDs String to define the type of ENSEMBL inputs. By default gene to intype

dicate "ensembl_gene_id". If different from "gene" it will be set to "en-

sembl_transcript_id_version".

String to define de organism, e.g. mmusculus, hsapiens, etc. By default organism

mmusculus.

Value

A string vector with the corresponding gene_symbols.

16 grepl.data.frame

Examples

```
gene_symbols =
get.gene.name(
  ensembl.id = c("ENSMUSG00000002111", "ENSMUSG00000027381"),
  type = "gene",
  organism = "mmusculus")
```

grepl.data.frame

Grep a pattern in a full data.frame.

Description

The function helps to define which rows of an input data.frame contain a specific patter.

Usage

```
grepl.data.frame(
  data.frame,
  pattern,
  ignore.case = FALSE,
  perl = FALSE,
  fixed = FALSE,
  useBytes = FALSE
)
```

Arguments

data.frame Input data.frame.

pattern Character string containing a regular expression (or character string for

fixed = TRUE) to be matched in the given character vector. Coerced by as.character to a character string if possible. If a character vector of length 2 or more is supplied, the first element is used with a warning.

Missing values are allowed except for regexpr and gregexpr.

ignore.case If FALSE, the pattern matching is case sensitive and if TRUE, case is ignored

during matching. By default FALSE.

perl Logical value to define if Perl-compatible regexps should be used. By

default FALSE.

fixed Logical value to define if the pattern is a string to be matched as is.

Overrides all conflicting arguments. By default FALSE.

useBytes Logical value to define if the matching is done byte-by-byte rather than

character-by-character. By default FALSE.

Value

It will be return a logic vector with an element per each row of the data.frame. The value is TRUE when the patter is found at least once in the corresponding data.frame row.

GSEA.to.GOnumber 17

Examples

```
iris = iris %>% filter(grepl.data.frame(iris, pattern = "setosa"))
```

GSEA.to.GOnumber

Conversion of GSEA terms into Gene Ontology numbers

Description

Helps to convert the terms of GSEA analyses into Gene Ontology (GO) ID numbers.

Usage

```
GSEA.to.GOnumber(
  input_terms,
  input_pvalue,
  return_table = T,
  export_table = F,
  output_file_name = paste(getwd(), "GO_numbers_table.tsv", sep = "/")
)
```

Arguments

input_terms A character vector containing the GSEA terms to be converted.
 input_pvalue A numeric vector containing the p-values of the GSEA terms.
 return_table Logic value to define whether to return the resulting data.frame. By default TRUE.

export_table Logic value to define whether to export the resulting data.frame. By default FALSE.

output_file_name

Path and file name of the output table if export is required. By default <working.directory>/GO_numbers_table.tsv.

Details

This functions requires the package GO.db.

If problems are encountered during the installation see $\verb|https://www.biostars.org/p/50564/|.$

Value

If required, returns a data.frame with 3 columns: GO_number, GO_annotation, p.value. This table could be directly exported.

18 IGVsnap

IGVsnap Script generator for Integrative Genomics Viewer tasks.	~ (IGV) batch
---	---------------

Description

Helps to the generation of a script file that can be run on IGV to generate multiple screenshots at specific genomic regions.

Usage

```
IGVsnap(
  loci_vector,
  input_type,
 biomart = "ensembl",
 dataset = "mmusculus_gene_ensembl",
  reference_genome = NULL,
 fivePrime = 1000,
  threePrime = 1000,
  snap_names = NULL,
  IGV_batch_file = paste(getwd(), "/IGV_batch.txt", sep = ""),
  snap_image_format = "png",
  snap_directory = getwd(),
 maxPanelHeight = 1000,
 session = NULL,
 exit = FALSE,
 help = FALSE
)
```

Arguments

 $loci_vector$

	vector (eg. c('chr1:253000-256503',). All IGV formats are allowed.
$input_type$	Define the input type. Allowed values are genes and regions.
biomart	Defines the biomart parameter for biomaRt package, by default ensembl.
dataset	Defines the dataset parameter for biomaRt package, by default mmusculus_gene_ensembl.
reference_genom	me
	[optional] Defines the genome to use, e.g. "mm10", "hg19", By default NULL.
fivePrime	Numeric value to define how many bases [bp] exapand from full gene position at it's 5'-end, default 1000bp.
threePrime	Numeric value to define how many bases [bp] exapand from full gene position at it's 3'-end, default 1000bp.
snap_names	[optional] String vector to define the names of images (without extention), by default uses loci_vector.

Either a gene name vector (e.g. c("Gapdh", "Spi1", ...)) or a regions

install.pkg.source 19

IGV_batch_file String for the batch_script_file_name/path, by default <working_directory>/IGV_batch.txt.snap_image_format

String to define the format of the images, e.g. "png", "jpeg", "svg",

By default png.

snap_directory String for the output directory for the snapshoots. By default work-

ing_directory;.

maxPanelHeight Numeric value to define the height in pixel of the IGV pannel that will

be captured on IGV.

session [optional] FULL path to an IGV session file (session.xml) to use for the

images. By default NULL.

exit Logical value to indicate whether exit IGV after image capture ended. By

default FALSE.

help Logical value to indicate whether display the help. By default FALSE.

Details

For more info on how batch tasks work on IGV see:

https://software.broadinstitute.org/software/igv/PortCommands.

Value

Exports a .txt file ready-to-use on IGV.

install.pkg.source Package installer from source archive.

Description

Allows the installation of R packages using the source archive file.

Usage

install.pkg.source(pkg.path)

Arguments

pkg.path String to define the path for the archive file to be installed.

Value

No returned value. The package required will be installed.

20 intersect.bedtools

intersect.bedtools $Intersect\ two\ or\ more\ bed\ files\ (by\ bedtools\ intersect\ function).$

Description

This function runs a command line that uses bedtools intersect to intersect one or more .bed files.

```
## S3 method for class 'bedtools'
intersect(
 a,
 b,
 outputFileName = paste(getwd(), "intersected.bed", sep = "/"),
  abam = FALSE,
 ubam = FALSE,
 bed = FALSE,
 wa = FALSE,
 wb = FALSE,
 loj = FALSE,
 wo = FALSE,
 wao = FALSE,
 u = FALSE,
 c = FALSE,
 C = FALSE,
  v = FALSE,
  f = NULL,
 F. = NULL,
  r = NULL,
 e = NULL,
 s = FALSE,
  S = FALSE,
  split = FALSE,
  sorted = FALSE,
 g = NULL,
  srun = FALSE,
  intersect.bedtools.command = "intersectBed",
  return.command = FALSE,
  return.bed = FALSE,
 delete.output = FALSE,
  run.command = TRUE
)
```

intersect.bedtools 21

Arguments

A single string defining the BAM/BED/GFF/VCF file "A". Each feature in A is compared to B in search of overlaps. Use "stdin" if passing A with a UNIX pipe. A character vector with one or more BAM/BED/GFF/VCF file(s) "B". b It could be also a single string containing wildcard (*) character(s). Full path to output file name. By default <working.directory>/intersected.bed. outputFileName abam Logic value to define if file A is a BAM. Each BAM alignment in A is compared to B in search of overlaps. By default FALSE. ubam Logic value to define if to write the output as uncompressed BAM. The default is to write compressed BAM output (ubam = FALSE). bed Logic value to define whether to write output as BED when using a BAM input abam = TRUE. The default is to write output in BAM (bed = FALSE). Logic value to define if to write the original entry in A for each overlap. wa By default FALSE. Logic value to define if to write the original entry in B for each overlap. wb Useful for knowing what A overlaps. Restricted by -f and -r. By default FALSE. Logic value to define if to perform a "left outer join". That is, for each loj feature in A report each overlap with B. If no overlaps are found, report a NULL feature for B. By default FALSE. Logic value to define if to write the original A and B entries plus the WO number of base pairs of overlap between the two features. Only A features with overlap are reported. Restricted by -f and -r. By default FALSE. Logic value to define if to write the original A and B entries plus the wao number of base pairs of overlap between the two features. However, A features w/o overlap are also reported with a NULL B feature and overlap = 0. Restricted by -f and -r. By default FALSE. Logic value to define if to write original A entry once if any overlaps found u in B. In other words, just report the fact at least one overlap was found in B. Restricted by -f and -r. By default FALSE. С Logic value to define if to for each entry in A, report the number of hits in B while restricting to -f. Reports 0 for A entries that have no overlap with B. Restricted -f, -F, -r, and -s. By default FALSE. Logic value to define if to for each entry in A, separately report the number С of overlaps with each B file on a distinct line. Reports 0 for A entries that have no overlap with B. Overlaps restricted by -f, -F, -r, and -s. By default FALSE. Logic value to define if to only report those entries in A that have no ٧ overlap in B. Restricted by -f and -r. f Numeric value defining the minimum overlap required as a fraction of A. Default is 1E-9 (i.e. 1bp). By default NULL. F. Numeric value defining the minimum overlap required as a fraction of B. Default is 1E-9 (i.e., 1bp). By default NULL.

22 intersect.bedtools

r	Numeric value defining the required reciprocal fraction of overlap for A and B. In other words, if -f is 0.90 and -r is used, this requires that B overlap at least 90% of A and that A also overlaps at least 90% of B. By default NULL.
е	Numeric value defining the minimum fraction to be satisfied for A $_OR_B$. In other words, if -e is used with -f 0.90 and -F 0.10 this requires that either 90% of A is covered OR 10% of B is covered. Without -e, both fractions would have to be satisfied. By default NULL.
S	Logic value to define if to force "strandedness". That is, only report hits in B that overlap A on the same strand. By default, overlaps are reported without respect to strand. By default FALSE.
S	Logic value to define if to require different strandedness. That is, only report hits in B that overlap A on the _opposite_ strand. By default, overlaps are reported without respect to strand. By default FALSE.
split	Logic value to define if to treat "split" BAM (i.e., having an "N" CIGAR operation) or BED12 entries as distinct BED intervals. By default FALSE.
sorted	Logic value to define, for very large B files, if to invoke a "sweeping" algorithm that requires position-sorted input. When using -sorted, memory usage remains low even for very large files. By default FALSE. It is possible to sort a bed file on terminal by (sort -k1,1 -k2,2n unsorted.bed > sorted.bed) or by the function sort.bed.
g	Specify a genome file the defines the expected chromosome order in the input files for use with the -sorted option. By default NULL.
srun	Logic value to define whether the command should be run in ${\sf srun}$ mode. By default ${\sf FALSE}.$
intersect.bedto	pols.command
	String to define the command to use to recall the bedtools intersect function. An example: "/home/user/anaconda3/bin/intersectBed". By default "intersectBed".
return.command	Logic value to define whether to return the string corresponding to the command for bedtools. By default ${\sf FALSE}.$
return.bed	Logic value to define whether to return the resulting bed as data.frame. By default FALSE. Parameter not active when inputs are bam files.
delete.output	Logic value to define whether to delete the exported intersected bed file. By default FALSE. Parameter active only when return.bed = TRUE. Useful when is sufficient to get the result as a data.frame without saving it.
run.command	Logic value to define whether to run the the command line on system terminal and generate the bed resulting from the intersection. By default $TRUE.$

Details

To know more about the bedtools intersect function see the package manual at the following link:

https://bedtools.readthedocs.io/en/latest/content/tools/intersect.html.

is.nan_df 23

Value

The function generates the files indicated by the output parameters. If required the command line used and/or the resulting intersected bed file. If both outputs are required, the output will be a named list with two values: "command" and "intersected.bed".

Examples

is.nan_df

is.nan() applied to a data.frame

Description

Applies the function is.nan() to a full data.frame.

Usage

```
is.nan_df(data.frame)
```

Arguments

data.frame

Input data.frame.

Value

It returns a matrix/array containing logic values for each element of the input data.frame. When TRUE it means that the corresponding element is a NaN.

```
is.nan.df(mtcars)
```

24 mass.to.volume

 ${\tt mass.to.volume} \qquad \qquad {\it Get \ solvent}$

Get solvent volume to make a solution with a given amount of a compound.

Description

Given a specific ammount of solute calculates the volume of solvent necessary to obtain a certain final molarity concentration.

Usage

```
mass.to.volume(
   final_concentration,
   final_concentration_unit = "M",
   mass,
   mass_unit = "g",
   MW
)
```

Arguments

final_concentration

Numeric value for the final concentration wanted.

final_concentration_unit

String to define the unit of the final concentration wanted. Available units are: "M", "mM", "uM", "nM", "pM", "fM". By default "M".

Mass Numeric value for the solute mass ammount.

mass_unit String to define the unit of the mass. Available units are: "kg", "g",

"mg", "ug", "ng". By default "g".

MW Numeric value for the Molecular Weigth (MW) of the compound expressed

in g/mol.

Value

It returns a string with the volume of solvent to use.

```
mass.to.volume(final_concentration = 5, mass = 10, MW = 215)
```

molarity.to.mass 25

molarity.to.mass

Get solvent volume to make a solution with a given amount of a compound.

Description

Given a specific volume of solution wanted calculates the mass of solute necessary to obtain a certain final molarity concentration.

Usage

```
molarity.to.mass(
   final_concentration,
   final_concentration_unit = "M",
   final_volume,
   final_volume_unit = "mL",
   MW
)
```

Arguments

final_concentration

Numeric value for the final concentration wanted.

final_concentration_unit

String to define the unit of the final concentration wanted. Available units are: "M", "mM", "uM", "nM", "pM", "fM". By default "M".

final_volume

Numeric value for the final volume wanted.

final_volume_unit

String to define the unit of the volume. Available units are: "L", "mL", "uL". By default "mL".

MW

Numeric value for the Molecular Weigth (MW) of the compound expressed in g/mol.

Value

It returns a string with the mass of compound to use.

```
molarity.to.mass(final_concentration = 5, final_volume = 10, MW = 215)
```

26 pkg.version

move.df.col	Function data.fram	change	easily	the	order	of	specific	columns	in	a

Description

Allows to change the position of a column in a data frame using other columns as reference.

Usage

```
move.df.col(data.frame, move.command)
```

Arguments

data.frame An input data.frame.

move.command A string containing the moving command. The command is formed as

follows: "columnA movingCommand columnB". The basic options are: "first", "last", "before", "after". Compounded moves must be separated

by a semicolon. Example: "g first; a last; e before c".

Value

It returns the original data.frame but with the columns moved as demanded.

References

https://stackoverflow.com/questions/3369959/moving-columns-within-a-data-frame-without-retyping

Examples

```
new.mtcars = move.df.col(mtcars, "mpg last")
new.mtcars = move.df.col(mtcars, "wt before carb")
new.mtcars = move.df.col(mtcars, "am before carb; cyl first")
```

pkg.version

Get session info and package versions.

Description

Retrieves the information of the current session and the version of the packages loaded.

```
pkg.version(return.session = F, print.versions = T, return.versions = F)
```

plot.density.profile 27

Arguments

```
return.session Logic value to define if to save the session info. By default FALSE.

print.versions Logic value to define if to print the session and version info. By default TRUE.

return.versions
```

Logic value to define if to save package versions info. By default FALSE.

Value

If return.session and/or return.versions TRUE a list with these informations is returned. Otherwise nothing is returned.

```
 \begin{array}{lll} {\it plot.} {\it density.profile} & {\it Plot~of~NGS~density~signal~at~specific~regions~from~deep\,Tools} \\ & {\it matrices.} \end{array}
```

Description

Plots the density profile of NGS data signals, using as input a score matrix computed by deeptools's computeMatrix function or by computeMatrix.deeptools from this package.

```
plot.density.profile(
 matrix.file,
 plot.by.group = T,
 missing.data.as.zero = NULL,
  sample.names = NULL,
  region.names = NULL,
  signal.type = "mean",
  error.type = "sem",
  plot.error = T,
  error.transparency = 0.125,
  title = NULL,
  x.lab = NULL,
  y.lab = NULL,
  line.type = "solid",
  line.width = 0.5,
  x.lim = NULL,
 y.lim = NULL,
 y.identical.auto = T,
  y.ticks.number = 5,
  text.size = 12,
  plot.vertical.lines = T,
 write.reference.points = T,
  colors = c("#00A5CF", "#F8766D", "#AC88FF", "#E08B00", "#00BA38", "#BB9D00",
    "#FF61C9", "gray30"),
```

28 plot.density.profile

```
n.row.multiplot = 1,
  export.multiplot = F,
 multiplot.export.file = paste(getwd(), "/multiplot.", Sys.Date(), "_", gsub(pattern =
    ":", replacement = ".", x = format(Sys.time(), "%X")), ".pdf", sep = ""),
  real.width.single.plot = 2.5,
  real.height.single.plot = 3,
 print.multiplot = F
)
```

Arguments

matrix.file A single string indicating a full path to a matrix.gz file generated by deepTools/computeMatrix or by computeMatrix.deeptools, or a list generated by the function read.computeMatrix.file.

plot.by.group Logic value to define whether plot by group of regions or by sample. By default TRUE.

missing.data.as.zero

Logic value to define whether treat missing data as 0. If set as FALSE missing data will be converted to NA and will be excluded from the computations of the signal. By default TRUE.

sample.names Samples names could be defined by a string vector. If set as NULL sample names will be get automatically by the matrix file. By default NULL. Example: c("sample1", "sample2", "sample3")

Region names could be defined by a string vector. If set as NULL sample region.names names will be get automatically by the matrix file. By default NULL. Example: c("regionA", "regionB")

String indicating the signal to be computed and plotted. Available pasignal.type rameters are "mean", "median" and "sum". By default "mean".

String indicating the type of error to be computed and plotted. Available error.type parameters are "sem" and "sd", standard error mean and standard deviation respectively. By default "sem". Parameter considered only when plot.error = TRUE).

plot.error Logic value to define whether to plot the error around the signal. By default TRUE.

error.transparency

Numeric value to define the alpha/transparency of the error. By default 0.125. Parameter considered only when plot.error = TRUE).

title Title of each plot could be defined by a string vector. If set as NULL titles will be generated automatically. By default NULL. Example: c("Title1", "Title2")

x.lab Single string to define the X-axis label for all the plots. By default NULL, the label will be defined automatically.

Single string to define the Y-axis label for all the plots. By default NULL, y.lab the label will be defined automatically.

line.type Vector to define each line type. Both numeric and string codes are accepted. If only one element is given this will be applied to all the lines. plot.density.profile 29

By default "solid".

Example 1: c("solid", "dashed").

Example 2: c(1,2)

line.width Numeric value to define the line width for all the plots. By default 0.5.

X.lim List of numeric vectors with two elements each to define the range of the X-axis. To set only one side use NA for the side to leave automatic. If only one range is given this one will be applied to all the plots. By default NULL, the range will be defined automatically.

Example list(c(0,20),c(NA,30),c(0,NA),c(NA,NA)).

y.lim

List of numeric vectors with two elements each to define the range of the Y-axis. To set only one side use NA for the side to leave automatic. If only one range is given this one will be applied to all the plots. By default NULL, the range will be defined automatically.

Example list(c(0,20),c(NA,30),c(0,NA),c(NA,NA)).

y.identical.auto

Logical value to define whether use the same Y-axis range for all the plots automatically depending on the values. Not used when y.lim is not NULL. By default TRUE.

y.ticks.number Define the number of ticks to display in the Y-axis. By default 5. Active only when y.identical.auto = TRUE.

text.size Numeric value to define the size of the text for the labels of all the plots. By default 12.

plot.vertical.lines

Logic value to define whether to plot a dashed gray vertical line in correspondence of the reference points of each plot. By default TRUE.

write.reference.points

Logic value to define whether to indicate the reference points on each plot. Applied only when x.lim is NULL. By default TRUE.

colors

Vector to define the line and error area colors. If only one value is provided it will applied to all the samples/groups. If the number of values is lower than the the required one, a random set of colors will be generated. All standard R.colors values are accepted. By default c("#00A5CF", "#F8766D", "#AC88FF", "#E08B00", "#00BA38", "#BB9D00", "#FF61C9", "gray30").

n.row.multiplot

Numeric value to define the number of rows in the final multiplot.

export.multiplot

Logic value to define whether to export the multiplot generated by the function. By default FALSE.

multiplot.export.file

Name of the PDF file of the multiplot to be exported when export.multiplot = T.

By default "/working_directory/multiplot_current.date_current.time.pdf".

real.width.single.plot

Numeric value, in inches, to define the real width of each plot in the multiplot exported, if required. By default 2.5 inches.

30 pStars

```
real.height.single.plot
```

Numeric value, in inches, to define the real height of each plot in the multiplot exported, if required. By default 3 inches.

```
print.multiplot
```

Logic value to define whether to print the multiplot once created. By default FALSE.

Details

To know more about the deepTools's function computeMatrix see the package manual at the following link:

https://deeptools.readthedocs.io/en/develop/content/tools/computeMatrix.html.

Value

The functions returns a list containing:

- data.table with the computed values used for the plot;
- metadata table with the information gotten from the matrix_file.gz;
- plot.list with a plot for each list element;
- multiplot with the image of all the plots together.

Examples

```
plot.density.profile(
   matrix.file = "/path.to/matrix.file.gz", plot.by.group = TRUE,
   missing.data.as.zero = NULL, sample.names = NULL, region.names = NULL,
   signal.type = "mean", error.type = "sem", plot.error = TRUE,
   error.transparency = 0.125, title = NULL, x.lab = NULL, y.lab = NULL,
   line.type = "solid", line.width = 0.5, x.lim = NULL, y.lim = NULL,
   y.identical.auto = TRUE, y.ticks.number = 5, text.size = 12,
   plot.vertical.lines = TRUE, colors = c("red", "blue", "#00BA38"),
   n.row.multiplot = 1, export.multiplot = FALSE,
   multiplot.export.file = "/path.to/multiplot.pdf",
   real.width.single.plot = 2.5, real.height.single.plot = 3,
   print.multiplot = FALSE)
```

pStars

P-value significance stars definer.

Description

Converts a p-value score in equivalent stars of significance.

```
pStars(p.value, one = 0.05, two = 0.01, three = 0.001, four = 1e-04)
```

Arguments

p.value	A single numeric value indicating the p-value to evaluate.
one	A numeric value to define the p-value threshold for the first level of significance (*). By default 0.05 .
two	A numeric value to define the p-value threshold for the second level of significance (**). By default 0.01 .
three	A numeric value to define the p-value threshold for the third level of significance (***). By default 0.001 .
four	A numeric value to define the p-value threshold for the fourth level of significance (****). By default 0.0001.

Value

It returns a string with the corresponding level of significance: NS, *, **, ***.

Examples

```
significance = pStars(0.002)
require(dplyr)
data.frame =
   data.frame %>%
   mutate(p.stars = sapply(data.frame$p.value.column, pStars))
```

Description

The function reads a matrix.file.gz generated by deepTools/computeMatrix function or by computeMatrix.deeptools. The value can be passed to plot.density.profile function.

${\bf Usage}$

```
read.computeMatrix.file(matrix.file)
```

Arguments

matrix.file A string indicating indicating the full path to the matrix.file.gz generated by deepTools/computeMatrix function or by computeMatrix.deeptools.

32 restriction.sites.to.bed

Value

The functions returns a named list containing:

• metadata data.frame with the information gotten from the matrix_file.gz;

- matrix.data data.frame with the scores gotten from;
- original.file.path with full path to the original matrix_file.gz.

This list can be passed as it is to the function plot.density.profile.

restore_packages

Restores packages installed from a .rda file.

Description

Installs the packages contained in a .rda file. This file can be generated by the store_packages function of this package.

Usage

```
restore_packages(rda_file)
```

Arguments

rda_file

Path to the .rda from which get the information for the packages to reinstall.

Value

If it was not possible to re-install al packages, the list of not restored packages will be returned.

restriction.sites.to.bed

Generator of a bed file for enzymatic restriction sites.

Description

The function allows to create a bed file that can be added on IGV both as regions and track. It will show the restriction sites of a sequences if starting from the cut positions depending on sequence length. Chromosome, start and end of the input sequence are required.

restriction.sites.to.bed 33

Usage

```
restriction.sites.to.bed(
  cut_positions,
  chromosome,
  genome_start,
  return_bed = TRUE,
  export_bed_file = FALSE,
  output_file_name = paste(getwd(), "restriction_positions.bed", sep = "/"),
  enzyme_cut_length = 4,
  include_region_description = TRUE,
  region_name = "site",
  append = FALSE
)
```

Arguments

cut_positions A numeric vector with the list of the restriction/cut positions.

chromosome Chromosome number of the region analyzed.

genome_start Start position on the genome of the region analyzed.

return_bed Logic value to define if to return the bed as data.frame. By default TRUE.

export_bed_file Logic value to define if to export the resulting .bed file. By default FALSE.
output_file_name

String corresponding to the path to the exported .bed file. By default "<working.directory>/restriction_positions.bed".

 $enzyme_cut_length$

Numeric value to define the length of cut of the restriction enzyme. By default 4.

include_region_description

Logic value to define whether to include a fourth column containing the region name define by the parameter $\mathsf{region_description}$. By default

TRUE.

region_name Regions base name. Automatically it will be added a number to the base

name. By default "site", the resulting regions will be: site_1, site_2,

append Logic value to define if to append the result to the file. By default FALSE,

the file will be overwritten.

Details

To map the positions of restriction enzymes it is possible to use http://restrictionmapper.org/ with the option Map (version 3).

Value

If required, it will be returned a classic bed file (chr start end [name]) with the regions centered on the cut position in the genome.

34 sort.bed

Examples

sort.bed

Sorter function for .bed files.

Description

Sorts .bed files by chromosome and position.

Usage

```
sort.bed(
  bed,
  bed.header = F,
  sep = "\t",
  return.bed = T,
  export.bed = F,
  export.file.name = paste(getwd(), "sorted.bed", sep = "/"),
  export.header = F
```

Arguments

bed Two options are possible:

- String with the path to a .bed file;

- Data frame corresponding to a bed file format (all the columns and their

names will be kept).

bed. header Logic value to define whether the .bed file contains an header or not. By

default FALSE.

sep String containing the separator character for a .bed file. By default "\t".

return.bed Logic value to define if to return the bed as a data.frame. By default

TRUE. Only unique rows are kept.

export.bed Logic value to define if to export the bed file. By default FALSE. Only

unique rows are kept.

export.file.name

String to define the path to the file to be exported, if required. By default

"<working.directory>/sorted.bed".

export.header Logic value to define whether the header should be exported in the sorted

bed file. By default FALSE.

store_packages 35

Details

The function keeps only unique rows.

To get more information about the bed file format see the following page:

https://genome.ucsc.edu/FAQ/FAQformat.html#format1.

Value

If required, returns a data frame corresponding to the sorted .bed file.

store_packages

Stores the information of installed packages in a .rda file.

Description

Saves the list of all the installed packages in a .rda file. This file can be used to restore the packages from a computer to another or after installation of a new R version by the function restore_packages of this package.

Usage

```
store_packages(output_directory = getwd())
```

Arguments

output_directory

Path to the directory in which export the .rda file. By default <working.directory>.

Value

Nothing is returned. An .rda file will be exported at the output_directory indicated.

substract.bw

Combination of two or more list in a unique one.

Description

Combines two or more lists in a single one keeping the elements names

```
substract.bw(
  bw1,
  bw2,
  wd = getwd(),
  return.substracted.bw = F,
  export.substracted.bw = T,
  substracted.bw.file = paste(getwd(), "subtraction.bw", sep = "/")
)
```

36 update_pkgs

Arguments

bw1 Full path to the first bigWig (the second one will be substracted to this

one).

bw2 Full path to the second bigWig (it will be substracted to the first one).

return.substracted.bw

Logic value to define whether return the resulting bigWig as GRanges

object. By default FALSE.

export.substracted.bw

Logic value to define whether export the resulting bigWig. By default

TRUE.

substracted.bw.file

String for the path of the resulting bigwig file to be exported.

By default <working.directory>/subtraction.bw.

Value

If required a subtraction bigWig is returned as GRanges object. The resulting bigWig can be also directly exported.

update_pkgs

function to automatically update the R packages.

Description

Automatically updates the R packages from CRAN and BioConductor repositories.

Usage

```
update_pkgs(ask = FALSE)
```

Arguments

ask

Logical indicating whether to ask the user to select packages before they are downloaded and installed, or the character string "graphics", which brings up a widget to allow the user to (de-)select from the list of packages which could be updated. (The latter value only works on systems with a GUI version of select.list, and is otherwise equivalent to ask = TRUE).

By default FALSE.

Value

Nothing. The packages will be updated.

Examples

update_pkgs()

volcano 37

volcano

Volcano plot generator for RNA-seq data.

Description

Generates a volcano plot in order to visualize the differentially expressed genes. The plot is highly customizable.

```
volcano(
  log2FC_data,
  padj_data,
 FC_t = 1.5
  p_t = 0.05
 FC_unresponsive_rigth = 1.1,
 FC_unresponsive_left = 1/FC_unresponsive_rigth,
 x_{ends} = NULL,
 y_min = 0,
 y_max = NULL,
  left_label = "UP",
  right_label = "DOWN",
  unresponsive_label = "NoResp",
  null_label = "NULL",
  names = as.character(c(1:length(log2FC_data))),
  left_names = FALSE,
  right_names = FALSE,
  padding = FALSE,
  names_size = 10,
  print_plot = F,
  left_color = "#00BA38";
  right_color = "#F8766D",
  unresponsive_color = "#00A5CF",
  null_color = "gray30",
  point_size = 0.5,
  legend = TRUE,
  legend_title = "Expression status",
  x_label = "log2(fold change expression)",
 y_label = "-log10(p-value adjusted)",
  title = "Volcano plot",
  sub_title = NULL,
  add_threshold_lines = T,
  threshold_line_color = "gray70",
  threshold_line_type = "dotted",
  font_family = "Helvetica",
)
```

38 volcano

Arguments

log2FC_data Numeric vector containing the log2(FoldChange) values of each gene.

padj_data Numeric vector of p-values. Use of adjusted p-values is recommended.

FC_t Value of the threshold to use for the fold change expression to define differentially expressed genes, expressed as linear value. By default 1.5

and by consequence 1/1.5.

p_t Value of the threshold to use for the p-values to define differentially ex-

pressed genes, expressed as linear value. By default 0.05.

 $FC_unresponsive_rigth$

Value of the threshold to use for the fold change expression to define unresponsive genes when FC > 1, expressed as linear value. By default 1.1. If NULL it will be calculated symmetrically from FC_NoResp_left as 1/FC_NoResp_left.

FC_unresponsive_left

Value of the threshold to use for the fold change expression to define unresponsive genes when FC < 1, expressed as linear value. By default $1/FC_unresponsive_rigth$. If NULL it will be calculated symmetrically

from FC_NoResp_rigth as 1/FC_NoResp_rigth.

x_ends Numeric positive value to define manually the range of the X-axis: it

will be calculated as $c(-x_ends,x_ends)$, for this reason the plot will be symmetrical. By default NULL, the range is assigned automatically and

the plot can be asymmetrical.

y_min Numeric value for the minimum value of the Y-axis. By default 0. Set it

to NULL for automatic computation.

y_max Numeric value for the maximum value of the Y-axis. By default NULL.

left_label String to indicate the label to use for the set of genes in the left side of

the graph (those with FoldChange < 1/FC_t and p.value < p_t. By default

"UP".

right_label String to indicate the label to use for the set of genes in the right side of

the graph (those with FoldChange > FC_t and p.value < p_t. By default

"DOWN".

unresponsive_label

String to indicate the label to use for the set of unresponsive genes (those with $FC_unresponsive_left < FoldChange < FC_unresponsive_rigth$ and

 $p.value > p_t$. By default "NoResp".

null_label String to indicate the label to use for the set of null genes (those with

1/FC_t < FoldChange < FC_t and p.value < p_t. By default "NULL".

names String vector with the names to be plotted if required, eg. gene names.

By default as.character(c(1:length(log2FC_data))).

left_names Logic value to indicate if to print the set of differentially expressed genes

in the left side of the graph (those with FoldChange < $1/FC_t$ and p.value

< p_t. By default FALSE.

right_names Logic value to indicate if to print the set of differentially expressed genes

in the right side of the graph (those with FoldChange > FC_t and p.value

 $< p_t$. By default FALSE.

volcano 39

padding Logic value to indicate if to plot the padding around the names of genes. By default FALSE. Numeric value to define de size of the point names size. By default 10. names_size print_plot Logic value to define whether to print the volcano plot once created. By left_color String to indicate the color to use for the set of genes in the left side of the graph (those with FoldChange < 1/FC_t and p.value < p_t. By default "#00BA38", a green. right_color String to indicate the color to use for the set of genes in the right side of the graph (those with FoldChange > FC_t and p.value < p_t. By default "#F8766D", a pink/red. unresponsive_color String to indicate the color to use for the set of unresponsive genes (those with FC_unresponsive_left < FoldChange < FC_unresponsive_rigth and $p.value > p_t$. By default "#00A5CF", a light blue. null_color String to indicate the color to use for the set of null genes (those with 1/FC_t < FoldChange < FC_t and p.value < p_t. By default "gray30", a dark gray. point_size Numeric value to define de size of the points. By default 0.5. legend Logic value to define if to print the legend. By default TRUE. legend_title A string to indicate the label of the legend title. By default "Expression status". A string to indicate the X-axis label. By default "log2(fold change x_label expression)". y_label A string to indicate the Y-axis label. By default "-log10(p-value adjusted)". title A string to indicate the title of the plot. By default "Volcano plot". A string to indicate the subtitle of the plot. By default NULL, no subtitle sub_title is written. add_threshold_lines Logic value to define if lines for the thresholds, both FC and p.value, should be plotted. By default TRUE. threshold_line_color String to define the color of the threshold lines. By default "gray70" threshold_line_type String or numeric value to define the threshold lines type. Both numeric and string standard R codes are accepted. By default "dotted", equivalent to 2. font_family String to define the font family to use in the plot writings. By default

Value

A plot in ggplot2 format.

"Helvetica".
