# Package 'Rseb'

February 20, 2021

Type Package
Title A package for NGS data managing and visualization
Version 0.1.7
Author Sebastian Gregoricchio
Maintainer Sebastian Gregoricchio < sebastian.gregoricchio@gmail.com>
Description  An R-package for daily tasks required to handle biological data as well as avoid recoding of small functions for quick but necessary data managing.
License GNU GENERAL PUBLIC LICENSE version 3
<b>Depends</b> R ( $\xi = 4.0.0$ )
Imports BiocManager, Biostrings, biomaRt, GO.db, rtracklayer, cowplot, data.table, ggplot2 ( $\xi$ = 3.3.3), ggrepel, ggpubr, matrixStats, plyr, dplyr, tidyr, purrr, robustbase, stringr, tools, devtools, rvcheck, curl
${ m biocViews}$
Encoding UTF-8
LazyData true
RoxygenNote 7.1.1

# Description

It verifies if Rseb is up-to-date and installs it when required.

build.bed 3

#### Usage

```
actualize(update = TRUE, verbose = TRUE, force = FALSE)
```

#### Arguments

update Logical value to define whether update the Rseb package. By default TRUE.

verbose Logical value to define whether print messages. By default TRUE.

Logical value to define whether to force the installation of Rseb even force

though already up-to-date. Parameter passed to devtools::install\_github().

By default FALSE.

## Details

This function will check for internet availability.

#### Value

Warnings and/or messages. Installation of the latest version of Rseb if required.

build.bed

Bed generator

## Description

Function that helps the building of a bed file providing the columns. It enables also the specification of the track line for software such as IGV in order to pre-define colors, track name, etc.

## Usage

```
build.bed(
  chr,
  start,
  end,
  name = NULL,
  score = 0,
  strand = ".",
  thickStart = NULL,
  thickEnd = NULL,
  itemRgb = NULL,
  blockCount = NULL,
  blockSizes = NULL,
  blockStarts = NULL,
  track.name = NULL,
  display.mode = NULL,
  itemRgb.ON = T,
  useScore = F,
```

4 build.bed

```
colorByStrand = NULL,
track.base.color = NULL,
sort = T,
bed.file.name = NULL,
export.track.line = TRUE,
return.data.frame = F,
force.generation = F
```

## Arguments

chr String vector containing the name of the chromosome (e.g. chr3, chrY,

chr2\_random) or scaffold (e.g. scaffold10671).

start Numeric vector indicating the starting position of the feature in the chro-

mosome or scaffold. The first base in a chromosome is numbered 0.

end Numeric vector indicating the ending position of the feature in the chro-

mosome or scaffold.

name String vector defining the name of the BED line. This label is displayed to

the left of the BED line in the Genome Browser window when the track is open to full display mode or directly to the left of the item in pack mode. If set as NULL (default) and the column is required, the names will

correspond to the mid-point of the region.

score A single value or a numeric vector with a score between 0 and 1000. If

the track line useScore attribute is set as TRUE for this annotation data set, the score value will determine the level of gray in which this feature

is displayed (higher numbers = darker gray). By default 0.

strand A single character or a string vector defining the strand: either "." (=no

strand) or "+" or "-". By default ".".

thickStart A numeric vector indicating the starting position at which the feature

is drawn thickly (for example, the start codon in gene displays). When there is no thick part (default value, thickStart = NULL) it will be used

the start value.

thickEnd A numeric vector indicating the ending position at which the feature is

drawn thickly (for example, the start codon in gene displays). When there is no thick part (default value, thickStart = NULL) it will be used the end

value.

itemRgb A single value or a string vector containing the colors for each feature.

It can be expressed as an RGB value of the form R,G,B (e.g. "255,0,0") or as any other R-supported color name (it will be converted automatically to RGB version). By default NULL. If the track line itemRgb.ON attribute is set as TRUE, this color value will determine the display color of the data contained in this BED line. NOTE: It is recommended that a simple color scheme (eight colors or less) be used with this attribute to avoid overwhelming the color resources of the Genome Browser and your

Internet browser.

blockCount A single number or a numeric vector indicating the number of blocks

(exons) in the BED line. By default NULL.

build.bed 5

blockSizes A vector containing a comma-separated list of the block sizes. The num-

ber of items in this list should correspond to blockCount. By default

blockStarts A vector containing a comma-separated list of block starts. All of the

> blockStart positions should be calculated relative to start. The number of items in this list should correspond to blockCount. By default NULL.

A string defining the track label that will be displayed to the left of the track.name

> track in the Genome Browser window, and also the label of the track control at the bottom of the screen. The name can consist of up to 15 characters. It is recommended that the track\_label be restricted to alphanumeric characters and spaces to avoid potential parsing problems. By

default NULL.

display.mode A string that defines the initial display mode of the annotation track. Values for display.mode include: "hide", "dense", "full", "pack", "squish".

By default NULL.

Logic value to define whether this attribute should be set to "On", the itemRgb.ON

> Genome Browser will use the RGB value shown in the itemRgb field in each data line of the associated BED track to determine the display color of the data on that line. If the itemRgb values are not provided, this

parameter will be ignored. By default TRUE.

useScore Logic value to define if the score field in each of the track's data lines should be used to determine the level of shading in which the data is

displayed. By default FALSE.

A vector composed by two strings for two colors, either in RGB comma

separated format (eg. "0,250,30") or any R-supported color string (they will be converted automatically to RGB format). The order of color sets is c("strand +", "strand -"). Parameter ignored when itemRgb is

active/provided. By default NULL.

track.base.color

A single string defining the main color for the annotation track. The track color consists of three comma-separated RGB values from 0-255 (eg. "0,250,30") or any R-supported color string (it will be converted automatically to RGB format). Parameter ignored when itemRgb or

colorByStrand are active/provided. By default NULL.

Logic value to define whether to sort the bed using the function sort.bed. sort By default TRUE.

bed.file.name If a string with a full path to a bed\_file is provided, the function will export the bed as a txt file. By default NULL.

= NULL this parameter is ignored. By default TRUE.

export.track.line

Logic value to define if the track line should be exported. When bed.file.name

return.data.frame

Logic value to define if the to return the data frame corresponding to the bed (it will show the columns names). By default FALSE.

force.generation

Force the generation of bed even when certain errors occur (eg. score ; 1000, start ; end). By default FALSE.

colorByStrand

6 calculate.mode

# Value

If required the function can export a bed file with or without the track line, return a data.frame (with column names) corresponding to the bed generated, or both. The bed file could be automatically sorted settin the parameter sort = TRUE.

# References

- More information about bed format are available at the following link: https://genome.ucsc.edu/FAQ/FAQformat.html#format1.
- More information about track line parameters are available at the following link: https://genome.ucsc.edu/goldenPath/help/hgTracksHelp.html#lines.

calculate.mode

 $Mode\ calculation$ 

## Description

Calculate the mode value of a vector of numeric values.

## Usage

```
calculate.mode(v)
```

## Arguments

V

A vector of numeric numbers

#### Value

A single number corresponding to the mode of the list of numbers give as input

## Examples

```
mode = calculate.mode(v = c(6, 8, 4, 845, 8, 5, 55, 84, 8, 84, 45, 5))
```

cmyk

cmyk $CMYK\ color\ converter$	
-------------------------------	--

# Description

Converts CMYK color values to hexadecimal color values

## Usage

```
cmyk(C, M, Y, K)
```

## Arguments

С	Value in the 0-100 range for the Cyan component.
М	Value in the 0-100 range for the Magenta component.
Υ	Value in the 0-100 range for the Yellow component.
K	Value in the 0-100 range for the Key component.

# Value

The result is a string for the color in hexadecimal scale, eg. "#FFFFFF".

# Examples

```
color = cmyk(0, 0, 0, 0)
```

radient Gradient colors generation and assignmen
--------------------------------------------------

# Description

Give a vector of colors generates a finite number of shadows that will be assigned to a numeric vector depending on the value of each element.

# Usage

```
color.gradient(values, colors = c("blue", "white", "red"), bins = 100)
```

# Arguments

values	A numeric vector containing the values to which a color must be assigned (NAs and NaN will be converted to 0).
colors	A string vector with the colors, in the wished order, that have to be used to generated the shadows. By default c("blue", "white", "red").
bins	An atomic integer value to define the total number of bins/steps in which the gradient should be dived.

## Value

A vector containing the assigned colors corresponding to each element of values.

combine.lists

List combiner

# Description

Combines two or more lists in a single one keeping the element names.

## Usage

```
combine.lists(list.of.lists)
```

## Arguments

list.of.lists A list of lists.

# Value

It returns a list that is a combination of the lists in the input list. If the list is not a nested list of list the original input is returned.

# Examples

```
combined_list = combine.lists(list.of.lists = list(list(c(1:2), c(1:3)), list("X" = c("A", "B"), "Y" = 2))) combined_list = combine.lists(list.of.lists = list(c(1:2), c(1:3)))
```

```
computeMatrix.deeptools
```

Score matrix NGS data builder at specific regions (by deeptools/computeMatrix function).

## Description

This function runs a command line that uses deeptools to calculate scores per genome regions and to prepare an intermediate file that can be used with plot.density.profile and plot.density.summary. Typically, the genome regions are genes, but any other regions defined in a BED file can be used. computeMatrix accepts multiple score files (bigWig format) and multiple regions files (BED format). This tool can also be used to filter and sort regions according to their score.

## Usage

```
computeMatrix.deeptools(
  mode,
  scoreFileName,
  regionsFileName,
  outFileName,
  outFileNameMatrix = NULL,
  outFileSortedRegions = NULL,
  referencePoint = "TSS",
  nanAfterEnd = FALSE,
  regionBodyLength = 1000,
  startLabel = "TSS",
  endLabel = "TES",
  unscaled5prime = 0,
  unscaled3prime = 0,
  upstream = 500,
  downstream = 500,
  binSize = 10,
  sortRegions = "keep",
  sortUsing = "mean",
  sortUsingSamples = NULL,
  averageTypeBins = "mean",
  missingDataAsZero = FALSE,
  skipZeros = FALSE,
  minThreshold = NULL,
  maxThreshold = NULL,
  blackListFileName = NULL,
  samplesLabel = NULL,
  smartLabels = TRUE,
  scale = 1,
  numberOfProcessors = "max",
  metagene = FALSE,
  transcriptID = "transcript",
  exonID = "exon",
  transcript_id_designator = "transcript_id",
  srun = FALSE,
  computeMatrix.deeptools.command = "computeMatrix",
  return.command = FALSE,
  run.command = TRUE,
  quiet = FALSE,
  verbose = FALSE
)
```

## Arguments

mode

The type of matrix computation. Allowed values are "reference-point" or "scale-region". No default.

#### • reference-point:

Reference-point refers to a position within a BED region (e.g., the starting point). In this mode, only those genomic positions before (upstream) and/or after (downstream) of the reference point will be plotted;

## • scale-region:

In the scale-regions mode, all regions in the BED file are stretched or shrunken to the length (in bases) indicated by the user.

scoreFileName

String vector with the full paths to bigWig file(s) containing the scores to be plotted.

#### regionsFileName

String vector with the full paths to .BED or .GTF files containing the regions to plot. If multiple bed files are given, each one is considered a group that can be plotted separately. Also, adding a "#" symbol in the bed file causes all the regions until the previous "#" to be considered one

outFileName

String containing the full file name to save the gzipped matrix file (.gz) needed by plot.density.profile.

#### outFileNameMatrix

If this option is given, then the matrix of values underlying the heatmap will be saved using the indicated name, e.g. IndividualValues.tab. This matrix can easily be loaded into R or other programs. By default NULL.

#### outFileSortedRegions

File name in which the regions are saved after skiping zeros or min/max threshold values. The order of the regions in the file follows the sorting order selected. This is useful, for example, to generate other heatmaps keeping the sorting of the first heatmap. Example: Heatmap1sortedRegions.bed. By default NULL.

referencePoint Possible choices: TSS, TES, center. The reference point for the plotting could be either the region start (TSS), the region end (TES) or the center of the region. Note that regardless of what you specify, plotHeatmap/plotProfile will default to using "TSS" as the label. By default TSS.

nanAfterEnd

Logic value. If set (TRUE), any values after the region end are discarded. This is useful to visualize the region end when not using the scale-regions mode and when the reference-point is set to the TSS. By default FALSE.

# regionBodyLength

Distance in bases to which all regions will be fit. (Default: 1000).

startLabel

Label shown in the plot for the start of the region. Default is TSS (transcription start site), but could be changed to anything, e.g. "peak start". Note that this is only useful if you plan to plot the results yourself and not, for example, with plotHeatmap, which will override this. (Default: "TSS").

endLabel

Label shown in the plot for the region end. Default is TES (transcription end site). See the -startLabel option for more information. (Default: "TES").

unscaled5prime Number of bases at the 5-prime end of the region to exclude from scaling.

By default, each region is scaled to a given length (see the –regionBodyLength option). In some cases it is useful to look at unscaled signals around region boundaries, so this setting specifies the number of unscaled bases on the 5-prime end of each boundary. (Default: 0).

unscaled3prime

Number of bases at the 3-prime end of the region to exclude from scaling. By default, each region is scaled to a given length (see the –regionBodyLength option). In some cases it is useful to look at unscaled signals around region boundaries, so this setting specifies the number of unscaled bases on the 3-prime end of each boundary. (Default: 0).

upstream Distance upstream of the reference-point selected. (Default: 500).

downstream Distance downstream of the reference-point selected. (Default: 500).

binSize Length, in bases, of the non-overlapping bins for averaging the score over

the regions length. (Default: 10).

sortRegions

Possible choices: "descend", "ascend", "no", "keep". Whether the output file should present the regions sorted. The default is to not sort the regions. Note that this is only useful if you plan to plot the results yourself and not, for example, with plotHeatmap, which will override this. Note also that unsorted output will be in whatever order the regions happen to be processed in and not match the order in the input files. If you require the output order to match that of the input regions, then either specify "keep" or use computeMatrixOperations to resort the results file. (Default: "keep").

sortUsing

Possible choices: "mean", "median", "max", "min", "sum", "region\_length". Indicate which method should be used for sorting. The value is computed for each row.Note that the region\_length option will lead to a dotted line within the heatmap that indicates the end of the regions. (Default: "mean").

#### sortUsingSamples

List of sample numbers (order as in matrix), that are used for sorting by –sortUsing, no value uses all samples, example: –sortUsingSamples 1 3. By default NULL.

## averageTypeBins

Possible choices: "mean", "median", "min", "max", "std", "sum". Define the type of statistic that should be used over the bin size range. (Default: "mean").

## missingDataAsZero

Logic value to define if set, missing data (NAs) will be treated as zeros. The default is to ignore such cases (NULL). If not included, this parameter can be changed later in the function plot.density.profile.

skipZeros

Logic value to understand whether regions with only scores of zero should be included or not. Default is to include them (FALSE).

minThreshold

Numeric value. Any region containing a value that is less than or equal to this will be skipped. This is useful to skip, for example, genes where the read count is zero for any of the bins. This could be the result of unmappable areas and can bias the overall results. (Default: NULL).

maxThreshold

Numeric value. Any region containing a value greater than or equal to this will be skipped. The maxThreshold is useful to skip those few regions with very high read counts (e.g. micro satellites) that may bias the average values. (Default: NULL).

#### blackListFileName

A BED file containing regions that should be excluded from all analyses. Currently this works by rejecting genomic chunks that happen to overlap an entry. Consequently, for BAM files, if a read partially overlaps a blacklisted region or a fragment spans over it, then the read/fragment might still be considered. (Default: NULL).

samplesLabel

Labels for the samples. This will then be passed to plot.density.profile function. The default is to use the file name of the sample. The sample labels should be separated by spaces and quoted if a label itself contains a space E.g. –samplesLabel label-1 "label 2".

smartLabels

Instead of manually specifying labels for the input bigWig and BED/GTF files, this causes deepTools to use the file name after removing the path and extension. (Default: TRUE).

scale

If set, all values are multiplied by this number. (Default: 1).

#### numberOfProcessors

Number of processors to use. Type " $\max/2$ " to use half the maximum number of processors or " $\max$ " to use all available processors. (Default: " $\max$ ").

metagene

When either a BED12 or GTF file are used to provide regions, perform the computation on the merged exons, rather than using the genomic interval defined by the 5-prime and 3-prime most transcript bound (i.e., columns 2 and 3 of a BED file). If a BED3 or BED6 file is used as input, then columns 2 and 3 are used as an exon. (Default: FALSE).

transcriptID

When a GTF file is used to provide regions, only entries with this value as their feature (column 3) will be processed as transcripts. (Default: "transcript").

exonID

When a GTF file is used to provide regions, only entries with this value as their feature (column 3) will be processed as exons. CDS would be another common value for this. (Default: "exon").

## transcript\_id\_designator

Each region has an ID (e.g., ACTB) assigned to it, which for BED files is either column 4 (if it exists) or the interval bounds. For GTF files this is instead stored in the last column as a key:value pair (e.g., as 'transcript\_id "ACTB"', for a key of transcript\_id and a value of ACTB). In some cases it can be convenient to use a different identifier. To do so, set this to the desired key. (Default: "transcript\_id").

srun

Logic value to define whether the command should be run in srun mode. By default FALSE.

#### computeMatrix.deeptools.command

String to define the command to use to recall the computeMatrix function of deeptools. An example: "/home/user/anaconda3/bin/computeMatrix". By default "computeMatrix".

return.command	Logic value to define whether to return the string corresponding to the command for deeptools. By default FALSE.
run.command	Logic value to define whether to run the the command line on system terminal and generate the score matrix by deeptools. By default $TRUE$ .
quiet	Logic value to define if to remove any warning or processing messages. By default ${\sf FALSE}.$
verbose	Logic value to define if to be VERY verbose in the status messages. –quiet

#### **Details**

To know more about the deeptools's **computeMatrix** function see the package manual at the following link:

https://deeptools.readthedocs.io/en/develop/content/tools/computeMatrix.html.

will disable this. By default FALSE.

#### Value

The function generates the files indicated by the output parameters. The matrix.gz output file can be read by the function read.computeMatrix.file.

## Examples

```
computeMatrix.deeptools(
  mode = "reference-point",
  scoreFileName = c("path_to/signal_file1.bw", "path_to/signal_file2.bw"),
  regionsFileName = c("path.to/regions1.bed", "path.to/regions2.bed"),
  upstream = 1000,
  downstream = 1000,
  outFileName = "path_to/output_matrix.gz",
  computeMatrix.deeptools.command = "/home/user/anaconda3/bin/computeMatrix",
   referencePoint = "peakMax")
computeMatrix.deeptools(
  mode = "scale-regions";
  scoreFileName = c("path_to/signal_file1.bw", "path_to/signal_file2.bw"),
  regionsFileName = c("path.to/regions1.bed", "path.to/regions2.bed"),
  upstream = 1000,
  downstream = 1000,
  regionBodyLength = 300,
  startLabel = "geneStart",
  endLabel = "geneEnd",
  outFileName = "path_to/output_matrix.gz",
  computeMatrix.deeptools.command = "/home/user/anaconda3/bin/computeMatrix",
   referencePoint = "peakMax")
```

14 data.frame.to.list

convert	seguence

Nucleic acid sequences converter.

## Description

Obtains de complementary, reverse complementary or the reverse of a DNA/RNA sequence.

## Usage

```
convert_sequence(sequence = NULL, mode = "not specified", nucleic.acid = "DNA")
```

## Arguments

sequence A string containing the sequence to be converted. By default NULL, it

returns an help for the mode.

mode A string value to define the modality of convertion. Possible options:

- Reverse complement = revComp — RC — rc — reverseComplement

- Reverse = rev - R - r - reverse

- Complement = comp - C - c - complement.

By default "not specified", it returns an help for the mode.

nucleic.acid A string to define the type of nucleic acid to which the input sequence

belongs. Available options "DNA", default value, or "RNA".

## Value

It returns a string with the converted sequence.

#### Examples

data.frame.to.list

Data frame conversion to a list of columns.

#### Description

Converts each column of a data frame in a element of a list with the corresponding name of the original column. Useful for further use in functions such as purrr::pmap().

## Usage

```
data.frame.to.list(x)
```

data.summary 15

## Arguments

x A data.frame to be converted

## Value

A list of vectors in which each element is a column of input the data.frame.

# Examples

```
data.frame.to.list(mtcars)
```

data.summary

Statistical data summary generator

## Description

Produces a table with a summary of the statistics for a specific column of an input data.frame by a group of values defined by a group defined by another column.

## Usage

```
data.summary(data, variable, group.names)
```

# Arguments

data Input data.frame to be analyzed.

variable A string with the name of the column to be analyzed.

group.names A string with the name of the column indicating the groups.

## Value

It returns a list that is a combination of the lists in the input list.

If the list is not a nested list of list the original input is returned.

## Examples

```
data.summary(data = mtcars, variable = "mpg", group.names = "disp")
```

DE.status

DE.status

Differential Expression status calculator for RNA-seq data

## Description

Defines the differential expression status of genes from RNA-seq data depending on fold change expression and adjusted p-value.

## Usage

```
DE.status(
  log2FC,
  p.value.adjusted,
  FC_threshold = 1.5,
  FC_NoResp_left = 0.9,
  FC_NoResp_rigth = NULL,
  p.value_threshold = 0.05,
  low.FC.status.label = "DOWN",
  high.FC.status.label = "UP",
  unresponsive.label = "NoResp",
  null.label = "NULL"
)
```

## **Arguments**

log2FC Numeric vector of log2(fold change expression) values.

p.value.adjusted

Numeric vector of p-values. Use of adjusted p-values is recommended.

FC\_threshold Value of the threshold to use for the fold change expression to define differentially expressed genes, expressed as linear value. By default 1.5 and by consequence 1/1.5.

FC\_NoResp\_left Value of the threshold to use for the fold change expression to define unresponsive genes when FC < 1, expressed as linear value. By default 0.9. If NULL it will be calculated symmetrically from FC\_NoResp\_rigth as 1/FC\_NoResp\_rigth.

FC\_NoResp\_rigth Value of the threshold to use for the fold change expression to define unresponsive genes when FC > 1, expressed as linear value. By default 1.1. If NULL it will be calculated symmetrically from FC\_NoResp\_left as 1/FC\_NoResp\_left.

p.value\_threshold

Value of the threshold to use for the p-values to define differentially expressed genes, expressed as linear value. By default 0.05.

low.FC.status.label

String to define the label indicating the differentially expressed genes with a FoldChange < FC\_threshold.

density\_plot 17

```
high.FC.status.label
```

String to define the label indicating the differentially expressed genes with a FoldChange > FC\_threshold.

unresponsive.label

String to define the label indicating the unresponsive genes identified as  ${\tt FC\_NoResp\_left} < {\tt FoldChange} < {\tt FC\_NoResp\_rigth} \ {\tt and} \ {\tt p.value} > {\tt p.value.threshold}.$ 

null.label String to define the label indicating the null genes.

#### Value

It returns a vector containing the differential expression status for each original value in the same order used in the input.

 $density\_plot$ 

Plot density signal of NGS data.

## Description

Plots the density profile of NGS data (e.g. ChIP-seq, ATAC-seq, MeDIP-seq, etc.). Used by the function plot.density.profile.

## Usage

```
density_plot(
  samples,
  scores,
  positions,
  variance_scores,
  xlab = "Distance from regions center [bp]",
 ylab = "Average density signal",
  line_type = "solid",
 y_{lim} = NULL,
  x_{lim} = NULL
  x_{intercept} = 0,
  colors = c("blue", "red", "purple", "orange", "green"),
  title = "Density profile",
  text_size = 12,
  variance = T,
  print_plot = F,
  line_width = 1,
  variance_opacity = 0.25
)
```

# Arguments

samples A character vector containing the samples list.

scores A numeric vector containing the scores for the Y-axis.

18 density\_plot

positions A numeric vector containing the position for the X-axis. variance\_scores A numeric vector containing the variance/error value at each position. xlab A string containing the label for the X-axis. By default "Distance from regions center [bp]". ylab A string containing the label for the Y-axis. By default "Average density signal". Vector to define each line type. Both numeric and string codes are acline\_type cepted. if only one element is given this will be applied to all the lines. By default "solid". Example 1: c("solid", "dashed"). Example 2: c(1,2)  $y_lim$ List of numeric vectors with two elements each to define the range of the Y-axis. To set only one side use NA for the side to leave automatic. If only one range is given this one will be applied to all the plots. By default NULL, the range will be defined automatically. Example list(c(0,20),c(NA,30),c(0,NA),c(NA,NA)).  $x_lim$ List of numeric vectors with two elements each to define the range of the X-axis. To set only one side use NA for the side to leave automatic. If only one range is given this one will be applied to all the plots. By default NULL, the range will be defined automatically. Example list(c(0,20), c(NA,30), c(0,NA), c(NA,NA)). x\_intercept A vector indicating the X intercepts for the vertical lines. By default 0. Vector to define the line and error area colors. If only one value is provided colors or the number of values is lower than the required ones only the first value will be used. All standard R.colors values are accepted. By default c("blue", "red", "purple", "orange", "green"). title A string containing the label for the X-axis. By default "Density profile". Numeric value to define the size of the text for the labels of all the plots. text\_size By default 12. variance Logic value to define whether to plot the error/variance around the signal. By default TRUE. print\_plot Logic value to define whether to print the plot once generated or not. By

Numeric value to define the alpha/transparency of the error/variance. By default 0.25. Parameter considered only when variance = TRUE).

Numeric value to define the line width for all the plots. By default 1.,

## Value

line\_width

variance\_opacity

Returns a plot in ggplot2 format.

default FALSE.

doughnut 19

doughnut

 $Donut/Doughnut\ plot$ 

# Description

Generation of a donut/doughnut plot (equivalent of a pie chart)

# Usage

```
doughnut(
    x,
    labels = as.character(x),
    edges = 200,
    outer.radius = 0.8,
    inner.radius = 0.4,
    clockwise = FALSE,
    init.angle = if (clockwise) 90 else 0,
    density = NULL,
    angle = 45,
    col = NULL,
    border = FALSE,
    lty = NULL,
    main = NULL,
    ...
)
```

# ${\bf Arguments}$

x	A vector containing the values to be plotted.
labels	A string vector for the labels of the different sectors. By default as $\operatorname{character}(x)$ .
edges	Number of edges of the shape. By default 200.
outer.radius	Fraction of the area to dedicate to the outer circle. By default 0.8.
inner.radius	Fraction of the area to dedicate to the inner circle. By default 0.4.
clockwise	Logic value to define whether the values should be plotted in clockwise sense. By default FALSE.
init.angle	Numeric value to define the starting angle for the data. By default if clockwise = TRUE 90, otherwise 0.
density	A vector or single number to define de density of the lines in the filling color of each value plotted. By default NULL.
angle	A vector or single number to define de angle of the lines in the filling color of each value plotted. By default 45.
col	A vector of R standard colors for each value to be plotted. By default NULL.

20 floating.ceiling

border Logic value to define whether plot the border of the sectors. By default

FALSE.

1ty Numeric value to define the type of line for the borders. By default NULL.

main String to set the title of the plot. By default NULL.

## References

```
https://magesblog.com/
```

# Examples

```
doughnut(x = c(3,5,9,12), inner.radius=0.5, col=c("red", "blue", "green", "yellow"))
```

floating.ceiling

Ceiling to floating values

## Description

Computes the ceiling of the given value but with any number of digits (to the closest floating number of given digits).

# Usage

```
floating.ceiling(num, digits = 1)
```

## Arguments

num A single number or a numeric vector.

digits A single integer indicating the maximum number of digits required.

# Value

A floored number or numeric vector.

floating.floor 21

£1+: £1	T71 : 4	. a:	1
floating.floor	Flooring $t$	о поанта	vaiues

## Description

Computes the floor of the given value but with any number of digits (to the closest floating number of given digits).

## Usage

```
floating.floor(num, digits = 1)
```

# Arguments

num A single number or a numeric vector.

digits A single integer indicating the maximum number of digits required.

## Value

A floored number or numeric vector.

get.gene.name Conversion of ENSEMBL gene IDs.
-----------------------------------------------

## Description

Conversion of ENSEMBL gene IDs to gene symbols.

#### Usage

```
get.gene.name(ensembl.id, type = "gene", organism = "mmusculus")
```

## Arguments

ensembl.id String vector of ENSEMBL genes IDs

type String to define the type of ENSEMBL inputs. By default gene to in-

dicate "ensembl\_gene\_id". If different from "gene" it will be set to "en-

sembl\_transcript\_id\_version".

organism String to define de organism, e.g. mmusculus, hsapiens, etc. By default

mmusculus.

## Value

A string vector with the corresponding gene\_symbols.

22 grepl.data.frame

## Examples

```
gene_symbols =
get.gene.name(
   ensembl.id = c("ENSMUSG00000002111", "ENSMUSG00000027381"),
   type = "gene",
   organism = "mmusculus")
```

grepl.data.frame

Grep a pattern in a full data.frame.

# Description

The function helps to define which rows of an input data.frame contain a specific patter.

## Usage

```
grepl.data.frame(
  data.frame,
  pattern,
  ignore.case = FALSE,
  perl = FALSE,
  fixed = FALSE,
  useBytes = FALSE
)
```

#### **Arguments**

data.frame Input data.frame.

pattern Character string containing a regular expression (or character string for

fixed = TRUE) to be matched in the given character vector. Coerced by as.character to a character string if possible. If a character vector of length 2 or more is supplied, the first element is used with a warning.

Missing values are allowed except for regexpr and gregexpr.

ignore.case If FALSE, the pattern matching is case sensitive and if TRUE, case is ignored

during matching. By default FALSE.

perl Logical value to define if Perl-compatible regexps should be used. By

default FALSE.

fixed Logical value to define if the pattern is a string to be matched as is.

Overrides all conflicting arguments. By default FALSE.

useBytes Logical value to define if the matching is done byte-by-byte rather than

character-by-character. By default FALSE.

# Value

It will be return a logic vector with an element per each row of the data.frame. The value is TRUE when the patter is found at least once in the corresponding data.frame row.

GSEA.to.GOnumber 23

## Examples

```
iris = iris %>% filter(grepl.data.frame(iris, pattern = "setosa"))
```

GSEA.to.GOnumber

Conversion of GSEA terms into Gene Ontology numbers

## Description

Helps to convert the terms of GSEA analyses into Gene Ontology (GO) ID numbers.

## Usage

```
GSEA.to.GOnumber(
  input_terms,
  input_pvalue,
  return_table = T,
  export_table = F,
  output_file_name = paste(getwd(), "GO_numbers_table.tsv", sep = "/")
)
```

#### **Arguments**

input\_terms A character vector containing the GSEA terms to be converted.
 input\_pvalue A numeric vector containing the p-values of the GSEA terms.
 return\_table Logic value to define whether to return the resulting data.frame. By default TRUE.
 export\_table Logic value to define whether to export the resulting data.frame. By default FALSE.

output\_file\_name

Path and file name of the output table if export is required. By default <working.directory>/GO\_numbers\_table.tsv.

#### **Details**

This functions requires the package GO.db.

If problems are encountered during the installation see  $\verb|https://www.biostars.org/p/50564/|.$ 

#### Value

If required, returns a data frame with 3 columns:  $GO_number$ ,  $GO_num$ ,

24 IGVsnap

IGVsnap	Script generator for Integrative Genomics Viewer (IGV) batch tasks.
	tasks.

## Description

The function builds a script file that can be run on IGV to generate multiple screenshots at specific genomic regions.

# Usage

```
IGVsnap(
  loci_vector,
  input_type,
 biomart = "ensembl",
 dataset = "mmusculus_gene_ensembl",
  reference_genome = NULL,
 fivePrime = 1000,
  threePrime = 1000,
  snap_names = NULL,
  IGV_batch_file = paste(getwd(), "/IGV_batch.txt", sep = ""),
  snap_image_format = "png",
  snap_directory = getwd(),
 maxPanelHeight = 1000,
 delay.interval = 10,
 session = NULL,
  exit = FALSE
)
```

## Arguments

loci_vector	Either a gene name vector (e.g. c("Gapdh", "Spi1",)) or a regions vector (eg. c('chr1:253000-256503',). All IGV formats are allowed.			
$input\_type$	Define the input type. Allowed values are genes and regions.			
biomart	Defines the biomart parameter for biomaRt package, by default ensembl.			
dataset	$Defines \ the \ {\tt dataset}\ parameter\ for\ {\tt biomaRt}\ package,\ by\ default\ {\tt mmusculus\_gene\_ensembl}.$			
reference_genome				
	[optional] Defines the genome to use, e.g. "mm9", "mm10", "hg19", "hg38", By default NULL.			
fivePrime	Numeric value to define of how many base-pairs (bp) expand from full gene position at it's 5'-end, default 1000bp.			
threePrime	Numeric value to define of how many base-pairs (bp) expand from full gene position at it's 3'-end, default 1000bp.			
snap_names	[optional] String vector to define the names of images (without extention), by default uses loci_vector.			

install.pkg.source 25

IGV\_batch\_file String for the batch\_script\_file\_name/path, by default <working\_directory>/IGV\_batch.txt.snap\_image\_format

String to define the format of the images, e.g. "png", "jpeg", "svg",  $\dots$ . By default png.

snap\_directory String for the output directory for the snapshoots. By default ¡work-

ing\_directory;.

maxPanelHeight Numeric value to define the height in pixel of the IGV pannel that will

be captured on IGV. By default 1000.

delay.interval Sets a delay (sleep) time in milliseconds. The sleep interval is invoked

between successive commands. By default 10. helps to give the time to

IGV to adapt the view before the snap (such as the autoscale).

session [optional] FULL path to an IGV session file (session.xml) to use for the

images. By default NULL.

exit Logical value to indicate whether exit IGV after image capture ended. By

default FALSE.

#### **Details**

To run the script on IGV: Tools ¿ Run Batch Script... ¿ choose the .txt output file from this function.

For more info on how batch tasks work on IGV see:

https://software.broadinstitute.org/software/igv/PortCommands.

## Value

Exports a .txt file ready-to-use on IGV.

install.pkg.source Package installer from source archive.

## Description

Allows the installation of R packages using the source archive file.

#### Usage

install.pkg.source(pkg.path)

#### **Arguments**

pkg.path String to define the path for the archive file to be installed.

#### Value

No returned value. The package required will be installed.

26 intersect.bedtools

intersect.bedtools Intersec

Intersect two or more bed files (by bedtools intersect function).

## Description

This function runs a command line that uses bedtools intersect to intersect one or more .bed files.

## Usage

```
intersect.bedtools(
  b,
  outputFileName = paste(getwd(), "intersected.bed", sep = "/"),
  abam = FALSE,
  ubam = FALSE,
 bed = FALSE,
 wa = FALSE,
 wb = FALSE,
  loj = FALSE,
 wo = FALSE,
 wao = FALSE,
 u = FALSE,
  c = FALSE,
 C = FALSE,
  v = FALSE,
  f = NULL,
  F. = NULL,
  r = FALSE,
  e = FALSE,
  s = FALSE,
  S = FALSE,
  split = FALSE,
  sorted = FALSE,
  g = NULL,
  srun = FALSE,
  intersect.bedtools.command = "intersectBed",
  return.command = FALSE,
  return.bed = FALSE,
  delete.output = FALSE,
  run.command = TRUE
)
```

#### Arguments

а

A single string defining the BAM/BED/GFF/VCF file "A". Each feature in A is compared to B in search of overlaps. Use "stdin" if passing A with

intersect.bedtools 27

	a UNIX pipe.
b	A character vector with one or more BAM/BED/GFF/VCF file(s) "B". It could be also a single string containing wildcard (*) character(s).
${\tt outputFileName}$	$Full\ path\ to\ output\ file\ name.\ By\ default\ \verb /intersected.bed .$
abam	Logic value to define if file A is a BAM. Each BAM alignment in A is compared to B in search of overlaps. By default FALSE.
ubam	Logic value to define if to write the output as uncompressed BAM. The default is to write compressed BAM output (ubam = FALSE).
bed	Logic value to define whether to write output as BED when using a BAM input abam = TRUE. The default is to write output in BAM (bed = FALSE).
wa	Logic value to define if to write the original entry in A for each overlap. By default FALSE.
wb	Logic value to define if to write the original entry in B for each overlap. Useful for knowing what A overlaps. Restricted by -f and -r. By default FALSE.
loj	Logic value to define if to perform a "left outer join". That is, for each feature in A report each overlap with B. If no overlaps are found, report a NULL feature for B. By default FALSE.
WO	Logic value to define if to write the original A and B entries plus the number of base pairs of overlap between the two features. Only A features with overlap are reported. Restricted by -f and -r. By default FALSE.
wao	Logic value to define if to write the original A and B entries plus the number of base pairs of overlap between the two features. However, A features w/o overlap are also reported with a NULL B feature and overlap = 0. Restricted by -f and -r. By default FALSE.
u	Logic value to define if to write original A entry once if any overlaps found in B. In other words, just report the fact at least one overlap was found in B. Restricted by -f and -r. By default FALSE.
С	Logic value to define if to for each entry in A, report the number of hits in B while restricting to -f. Reports 0 for A entries that have no overlap with B. Restricted -f, -F, -r, and -s. By default FALSE.
С	Logic value to define if to for each entry in A, separately report the number of overlaps with each B file on a distinct line. Reports 0 for A entries that have no overlap with B. Overlaps restricted by -f, -F, -r, and -s. By default FALSE.
V	Logic value to define if to only report those entries in A that have no overlap in B. Restricted by -f and -r.
f	Numeric value defining the minimum overlap required as a fraction of A. Default is 1E-9 (i.e. 1bp). By default NULL.
F.	Numeric value defining the minimum overlap required as a fraction of B. Default is 1E-9 (i.e., 1bp). By default $NULL$ .
r	Logic value defining if the fraction (parameter $f$ ) is required to be reciprocal fraction of overlap for A and B. In other words, if -f is 0.90 and -r is used, this requires that B overlap at least 90% of A and that A also overlaps at least 90% of B. By default NULL.

28 intersect.bedtools

Logic value defining if the fraction (parameter f) must be satisfied for A $\_OR\_B$ . In other words, if -e is used with -f 0.90 and -F 0.10 this requires that either 90% of A is covered OR 10% of B is covered. Without -e, both fractions would have to be satisfied. By default NULL.
Logic value to define if to force "strandedness". That is, only report hits in B that overlap A on the same strand. By default, overlaps are reported without respect to strand. By default FALSE.
Logic value to define if to require different strandedness. That is, only report hits in B that overlap A on the _opposite_ strand. By default, overlaps are reported without respect to strand. By default FALSE.
Logic value to define if to treat "split" BAM (i.e., having an "N" CIGAR operation) or BED12 entries as distinct BED intervals. By default FALSE.
Logic value to define, for very large B files, if to invoke a "sweeping" algorithm that requires position-sorted input. When using -sorted, memory usage remains low even for very large files. By default FALSE. It is possible to sort a bed file on terminal by (sort -k1,1 -k2,2n unsorted.bed > sorted.bed) or by the function sort.bed.
Specify a genome file the defines the expected chromosome order in the input files for use with the -sorted option. By default NULL.
Logic value to define whether the command should be run in ${\sf srun}$ mode. By default ${\sf FALSE}.$
pols.command
String to define the command to use to recall the bedtools intersect function. An example: "/home/user/anaconda3/bin/intersectBed". By default "intersectBed".
Logic value to define whether to return the string corresponding to the command for bedtools. By default FALSE.
Logic value to define whether to return the resulting bed as data.frame. By default FALSE. Parameter not active when inputs are bam files.
Logic value to define whether to delete the exported intersected bed file. By default FALSE. Parameter active only when return.bed = TRUE. Useful when is sufficient to get the result as a data.frame without saving it.
Logic value to define whether to run the the command line on system terminal and generate the bed resulting from the intersection. By default $TRUE.$

## Details

To know more about the bedtools intersect function see the package manual at the following link:

https://bedtools.readthedocs.io/en/latest/content/tools/intersect.html.

## Value

The function generates the files indicated by the output parameters. If required the command line used and/or the resulting intersected bed file. If both outputs are required, the output will be a named list with two values: "command" and "intersected.bed".

is.color 29

## Examples

is.color

is.color

# Description

Function to define if each element of a string vector is an R-supported color string.

## Usage

```
is.color(x)
```

## Arguments

Х

A string vector.

## Value

A logical vector of the same length of  $\boldsymbol{x}$ .

is.nan\_df

is.nan() applied to a data.frame

## Description

Applies the function is.nan() to a full data.frame.

# Usage

```
is.nan_df(data.frame)
```

## Arguments

data.frame

Input data.frame.

30 mass.to.volume

## Value

It returns a matrix/array containing logic values for each element of the input data.frame. When TRUE it means that the corresponding element is a NaN.

## Examples

```
is.nan.df(mtcars)
```

mass.to.volume

Get solvent volume to make a solution with a given amount of a compound.

## Description

Given a specific ammount of solute calculates the volume of solvent necessary to obtain a certain final molarity concentration.

## Usage

```
mass.to.volume(
   final_concentration,
   final_concentration_unit = "M",
   mass,
   mass_unit = "g",
   MW
)
```

# Arguments

final\_concentration

Numeric value for the final concentration wanted.

final\_concentration\_unit

String to define the unit of the final concentration wanted. Available units

are: "M", "mM", "uM", "nM", "pM", "fM". By default "M".

mass Numeric value for the solute mass ammount.

mass\_unit String to define the unit of the mass. Available units are: "kg", "g",

"mg", "ug", "ng". By default "g".

MW Numeric value for the Molecular Weigth (MW) of the compound expressed

in g/mol.

## Value

It returns a string with the volume of solvent to use.

## Examples

```
mass.to.volume(final_concentration = 5, mass = 10, MW = 215)
```

molarity.to.mass 31

molarity.to.mass

Get solvent volume to make a solution with a given amount of a compound.

## Description

Given a specific volume of solution wanted calculates the mass of solute necessary to obtain a certain final molarity concentration.

## Usage

```
molarity.to.mass(
   final_concentration,
   final_concentration_unit = "M",
   final_volume,
   final_volume_unit = "mL",
   MW
)
```

# Arguments

final\_concentration

Numeric value for the final concentration wanted.

final\_concentration\_unit

String to define the unit of the final concentration wanted. Available units are: "M", "mM", "uM", "nM", "pM", "fM". By default "M".

final\_volume

Numeric value for the final volume wanted.

final\_volume\_unit

String to define the unit of the volume. Available units are: "L", "mL", "uL". By default "mL".

MW

Numeric value for the Molecular Weigth (MW) of the compound expressed in g/mol.

# Value

It returns a string with the mass of compound to use.

## Examples

```
molarity.to.mass(final_concentration = 5, final_volume = 10, MW = 215)
```

32 pkg.check

nction to change ta.frame.	easily the order	of specific columns	in	a

## Description

Allows to change the position of a column in a data frame using other columns as reference.

## Usage

```
move.df.col(data.frame, move.command)
```

# Arguments

data.frame An input data.frame.

move.command A string containing the moving command. The command is formed as

follows: "columnA movingCommand columnB". The basic options are: "first", "last", "before", "after". Compounded moves must be separated

by a semicolon. Example: "g first; a last; e before c".

#### Value

It returns the original data.frame but with the columns moved as demanded.

## References

https://stackoverflow.com/questions/3369959/moving-columns-within-a-data-frame-without-retyping

## Examples

```
new.mtcars = move.df.col(mtcars, "mpg last")
new.mtcars = move.df.col(mtcars, "wt before carb")
new.mtcars = move.df.col(mtcars, "am before carb; cyl first")
```

pkg.check

Check package installation.

## Description

Function to check if a package is installed. It works with bioconductor or CRAN packages.

## Usage

```
pkg.check(package, archive)
```

pkg.version 33

## Arguments

package A single string indicating the name of the package to check.

archive A single string indicating the type of archive. Possible values "CRAN"

and "bioconductor" (not case sensitive). Parameter without default...

## Value

If the pkg is not already installed it will be installed.

## Examples

```
pkg.check("ggplot2", "cran")
pkg.check("biomaRt", "bioconductor")
```

pkg.version

Get session info and package versions.

## Description

Retrieves the information of the current session and the version of the packages loaded.

## Usage

```
pkg.version(return.session = F, print.versions = T, return.versions = F)
```

## Arguments

return.session Logic value to define if to save the session info. By default FALSE.

print.versions Logic value to define if to print the session and version info. By default

TRUE.

return.versions

Logic value to define if to save package versions info. By default FALSE.

## Value

If return.session and/or return.versions TRUE a list with these informations is returned. Otherwise nothing is returned.

34 plot.density.profile

```
{\it plot.density.profile} \quad {\it Plot~of~NGS~density~signal~at~specific~regions~from~deep Tools} \\ {\it matrices.}
```

## Description

Plots the density profile of NGS data signals, using as input a score matrix computed by deeptools's computeMatrix function or by computeMatrix.deeptools from this package.

## Usage

```
## S3 method for class 'density.profile'
plot(
 matrix.file,
  plot.by.group = T,
 missing.data.as.zero = NULL,
  sample.names = NULL,
  region.names = NULL,
  signal.type = "mean",
  error.type = "sem",
  plot.error = T,
  error.transparency = 0.125,
  title = NULL,
  x.lab = NULL,
  y.lab = NULL,
  line.type = "solid",
  line.width = 0.5,
  x.lim = NULL,
  y.lim = NULL,
 y.identical.auto = T,
 y.ticks.interval = NULL,
  y.digits = 1,
  text.size = 12,
  legend.position = c(0.2, 0.85),
  plot.vertical.lines = T,
  write.reference.points = T,
  colors = c("#00A5CF", "#F8766D", "#AC88FF", "#E08B00", "#00BA38", "#BB9D00",
    "#FF61C9", "gray30"),
  n.row.multiplot = 1,
  multiplot.export.file = NULL,
  real.width.single.plot = 2.9,
  real.height.single.plot = 3.5,
  by.row = TRUE,
  print.multiplot = F
)
```

plot.density.profile 35

#### Arguments

matrix.file A single string indicating a full path to a matrix.gz file generated by deepTools/computeMatrix or by computeMatrix.deeptools, or a list generated by the function read.computeMatrix.file. Logical value to define whether plot by group of regions or by sample. By plot.by.group default TRUE. missing.data.as.zero Logical value to define whether treat missing data as 0. If set as FALSE missing data will be converted to NA and will be excluded from the computations of the signal. By default TRUE. Samples names could be defined by a string vector. If set as NULL sample sample.names names will be get automatically by the matrix file. By default NULL. Example: c("sample1", "sample2", "sample3") region.names Region names could be defined by a string vector. If set as NULL sample names will be get automatically by the matrix file. By default NULL. Example: c("regionA", "regionB") String indicating the signal to be computed and plotted. Available pasignal.type rameters are "mean", "median" and "sum". By default "mean". String indicating the type of error to be computed and plotted. Available error.type parameters are "sem" and "sd", standard error mean and standard deviation respectively. By default "sem". Parameter considered only when plot.error = TRUE). plot.error Logical value to define whether to plot the error around the signal. By default TRUE. error.transparency Numeric value to define the alpha/transparency of the error. By default 0.125. Parameter considered only when plot.error = TRUE). title Title of each plot could be defined by a string vector. If set as NULL titles will be generated automatically. By default NULL. Example: c("Title1","Title2") x.lab

Single string or string vector to define the X-axis label for all the plots.

By default NULL, the label will be defined automatically. Single string or string vector to define the Y-axis label for all the plots.

y.lab By default NULL, the label will be defined automatically.

Vector to define each line type. Both numeric and string codes are acline.type cepted. If only one element is given this will be applied to all the lines. By default "solid".

Example 1: c("solid", "dashed").

Example 2: c(1,2)

line.width Numeric value to define the line width for all the plots. By default 0.5.

x.lim List of numeric vectors with two elements each to define the range of the X-axis. To set only one side use NA for the side to leave automatic. If only one range is given this one will be applied to all the plots. By default NULL, the range will be defined automatically.

Example list(c(0,20),c(NA,30),c(0,NA),c(NA,NA)).

36 plot.density.profile

y.lim

List of numeric vectors with two elements each to define the range of the Y-axis. To set only one side use NA for the side to leave automatic. If only one range is given this one will be applied to all the plots. By default NULL, the range will be defined automatically.

Example list(c(0,20),c(NA,30),c(0,NA),c(NA,NA)).

#### y.identical.auto

Logical value to define whether use the same Y-axis range for all the plots automatically depending on the values. Not used when y.lim is not NULL. By default TRUE.

#### y.ticks.interval

A number indicating the interval/bin spacing two ticks on the Y-axis. By default NULL: ticks are assigned automatically. Active only when y.identical.auto = TRUE and y.lim != NULL.

y.digits A numeric value to define the number of digits to use for the y.axis values. By default 1 (eg. 1.5).

text.size Numeric value to define the size of the text for the labels of all the plots. By default 12.

legend.position

Any ggplot supported value for the legend position (eg. "none", top", "bottom", "left", "right", c(fraction.x, fraction.y)). By default c(0.2,0.85).

plot.vertical.lines

Logical value to define whether to plot a dashed gray vertical line in correspondence of the reference points of each plot. By default TRUE.

write.reference.points

Logical value to define whether to indicate the reference points on each plot. Applied only when x.lim is NULL. By default TRUE.

colors

Vector to define the line and error area colors. If only one value is provided it will applied to all the samples/groups. If the number of values is lower than the the required one, a random set of colors will be generated. All standard R.colors values are accepted. By default

c("#00A5CF", "#F8766D", "#AC88FF", "#E08B00", "#00BA38", "#BB9D00", "#FF61C9", "gray30").

n.row.multiplot

Numeric value to define the number of rows in the final multiplot.

multiplot.export.file

If a string with the name of a PDF file is provided the multiplot will be exported. By default NULL.

real.width.single.plot

Numeric value, in inches, to define the real width of each plot in the multiplot exported, if required. By default 2.9 inches.

real.height.single.plot

Numeric value, in inches, to define the real height of each plot in the multiplot exported, if required. By default 3.5 inches.

by.row Logical value to define whether the plots should be arranged by row. By default TRUE.

print.multiplot

Logical value to define whether to print the multiplot once created. By default FALSE.

CO101 3

#### **Details**

To know more about the deepTools's function computeMatrix see the package manual at the following link:

https://deeptools.readthedocs.io/en/develop/content/tools/computeMatrix.html.

# Value

The functions returns a list containing:

- data.table with the computed values used for the plot;
- metadata table with the information gotten from the matrix\_file.gz;
- plot.list with a plot for each list element;
- multiplot with the image of all the plots together.

### Examples

```
plot.density.profile(
  matrix.file = "/path.to/matrix.file.gz", plot.by.group = TRUE,
  missing.data.as.zero = NULL, sample.names = NULL, region.names = NULL,
  signal.type = "mean", error.type = "sem", plot.error = TRUE,
  error.transparency = 0.125, title = NULL, x.lab = NULL, y.lab = NULL,
  line.type = "solid", line.width = 0.5, x.lim = NULL, y.lim = NULL,
  y.identical.auto = TRUE, y.ticks.number = 5, text.size = 12,
  plot.vertical.lines = TRUE, colors = c("red", "blue", "#00BA38"),
  n.row.multiplot = 1, multiplot.export.file = "/path.to/multiplot.pdf",
  real.width.single.plot = 2.5, real.height.single.plot = 3,
  print.multiplot = FALSE)
```

 $\begin{array}{ll} {\it plot.density.summary} & {\it Plot~the~distribution~of~overall~NGS~density~at~specific~regions} \\ & {\it from~deepTools~matrices.} \end{array}$ 

# Description

Computes the score of each element in a list of regions and generates violins plots with percentiles and the mean (optional) for each sample/region. It uses as input a score matrix computed by deeptools's computeMatrix function or by computeMatrix.deeptools from this package.

# Usage

```
## S3 method for class 'density.summary'
plot(
  matrix.file,
  plot.by.group = T,
  missing.data.as.zero = NULL,
  sample.names = NULL,
```

```
region.names = NULL,
signal.type = "mean",
linear = F,
error.type = "sem",
show.mean = T,
mean.error.type = "se",
mean.color = "blue",
mean.symbol.shape = 20,
mean.symbol.size = 1,
show.stat.multiplot = T,
stat.method = "wilcox.test",
stat.paired = F,
stat.labels.format = "p.signif",
stat.hide.ns = T,
stat.p.levels = list(cutpoints = c(0, 1e-04, 0.001, 0.01, 0.05, 1), symbols =
  c("****", "***", "**", "*", "ns")),
title = NULL,
x.lab = NULL,
y.lab = NULL,
x.labs.angle = 0,
dodge.width = 1,
border.width = 0.5,
transparency = 0.5,
subset.range = NULL,
y.lim = NULL,
y.identical.auto = T,
y.ticks.interval = NULL,
y.digits = 1,
text.size = 12,
legend.position = c(0.2, 0.85),
colors = c("#00A5CF", "#F8766D", "#AC88FF", "#E08B00", "#00BA38", "#BB9D00",
  "#FF61C9", "gray30"),
n.row.multiplot = 1,
multiplot.export.file = NULL,
real.width.single.violinplot = 1,
real.height.single.violinplot = 3.5,
by.row = TRUE,
print.multiplot = F
```

#### Arguments

Matrix.file A single string indicating a full path to a matrix.gz file generated by deepTools/computeMatrix or by computeMatrix.deeptools, or a list generated by the function read.computeMatrix.file.

plot.by.group Logical value to define whether plot by group of regions or by sample. By default TRUE.

missing.data.as.zero

Logical value to define whether treat missing data as 0. If set as FALSE

missing data will be converted to NA and will be excluded from the computations of the signal. By default TRUE.

sample.names Samples names could be defined by a string vector. If set as NULL sample

names will be get automatically by the matrix file. By default NULL.

Example: c("sample1", "sample2", "sample3")

region.names Region names could be defined by a string vector. If set as NULL sample

names will be get automatically by the matrix file. By default NULL.

Example: c("regionA", "regionB")

signal.type String indicating the signal to be computed and plotted. Available pa-

rameters are "mean", "median" and "sum". By default "mean".

linear Logical value to define whether the plots should show the score in linear

scale. By default FALSE.

error.type String indicating the type of error to be computed and that will be avail-

able in the output data.table. Available parameters are "sem" and "sd", standard error mean and standard deviation respectively. By default

"sem". Parameter considered only when show.mean = TRUE).

show.mean Logical value to define whether the mean value should be shown as a

symbol on the plots. By default TRUE.

mean.error.type

String indicating the type of error for the mean to be computed. Available parameters are "se", "sd" and, "none". Respectively standard error, standard deviation, and no error plotted. By default "se". Parameter

considered only when show.mean = TRUE).

mean.color A single string expressing an R-supported color for the mean symbol. By

default "blue".

mean.symbol.shape

A numeric value or string defining the shape for the mean symbol. By

default 20.

mean.symbol.size

A numeric value defining the size of the mean symbol. By default 1.

show.stat.multiplot

Logical value to define if to add to the plot the statistical comparisons of the means for the groups present in the multiplot. By default TRUE. All

possibile comparisons will be performed.

stat.method A single string defining the method to use for the statistical comparisons.

By default "wilcox.test". Available options: "t.test" "wilcox.test".

stat.paired Logical value to define if the statistical comparisons should be performed

paired. By default "FALSE". Notice that to allow a paired comparison the number of data should be the same in the two groups compared, so in the most of the cases non applicable to the comparisons between two

regions. Used only in "t.test" and "wilcox.test" methods.

stat.labels.format

A single string indicating the format of the p-value to show for the statistical comparisons. By default "p.signif". Available options: "p.format" (normal p-value), "p.signif" (significance stars), "p.adj" (p-value adjusted).

Logical value indicating if the NS ("Not Significant") comparisons should stat.hide.ns be shown or not. By default TRUE.

A list containing the p-values levels/thresholds in the following format stat.p.levels (default): list(cutpoints = c(0,0.0001,0.001,0.01,0.05,1), symbols =c("\*\*\*\*","\*\*\*","\*\*","ns")). In other words, we use the following convention for symbols indicating statistical significance:

- ns: p ; 0.05
- \* p := 0.05
- \*\* p := 0.01
- \*\*\* p j= 0.001
- \*\*\*\* p := 0.0001

title Title of each plot could be defined by a string vector. If set as NULL titles will be generated automatically. By default NULL.

Example: c("Title1", "Title2")

x.lab Single string or string vector to define the X-axis label for all the plots. By default NULL, the label will be defined automatically.

y.lab Single string or string vector to define the Y-axis label for all the plots. By default NULL, the label will be defined automatically.

x.labs.angle A single numeric value indicating the degrees of rotation of the category labels in the X-axis. By default 0, horizontal without rotation.

dodge.width Numeric value defining the width of each single violin plot. By default 1.

border.width Numeric value to define the border width for all the plots. By default 0.5.

A numeric value to define the fraction of transparency of the plots fill (0 transparency = transparent, 1 = full). By default 0.5.

A numeric vector indicating the range to which restrict the analyses (eg. subset.range c(-150, 250)). In the case of "scale-region" mode, the range is represented by (-upstream — 0 — body\_length — body\_length+downstream).By default NULL: the whole region is considered.

y.lim List of numeric vectors with two elements each to define the range of the Y-axis. To set only one side use NA for the side to leave automatic. If only one range is given this one will be applied to all the plots. By default NULL, the range will be defined automatically.

Example list(c(0,20),c(NA,30),c(0,NA),c(NA,NA)).

# y.identical.auto

Logical value to define whether use the same Y-axis range for all the plots automatically depending on the values. Not used when y.lim is not NULL. By default TRUE.

#### y.ticks.interval

A number indicating the interval/bin spacing two ticks on the Y-axis. By default NULL: ticks are assigned automatically. Active only when y.identical.auto = TRUE and y.lim != NULL.

y.digits A numeric value to define the number of digits to use for the y.axis values. By default 1 (eg. 1.5).

plot.density.summary

41

text.size

Numeric value to define the size of the text for the labels of all the plots. By default 12.

legend.position

Any ggplot supported value for the legend position (eg. "none, "top", "bottom", "left", "right", c(fraction.x, fraction.y)). By default c(0.2,0.85).

colors

Vector to define the line and error area colors. If only one value is provided it will applied to all the samples/groups. If the number of values is lower than the the required one, a random set of colors will be generated. All standard R.colors values are accepted. By default c("#00A5CF", "#F8766D", "#AC88FF", "#E08B00", "#00BA38", "#BB9D00", "#FF61C9", "gray30").

n.row.multiplot

Numeric value to define the number of rows in the final multiplot.

multiplot.export.file

If a string with the name of a PDF file is provided the multiplot will be exported. By default NULL.

real.width.single.violinplot

Numeric value, in inches, to define the real width (not precise) of each single violin plot in the multiplot exported, if required. By default 1 inch.

real.height.single.violinplot

Numeric value, in inches, to define the real height (not precise) of each single violin plot in the multiplot exported, if required. By default 3.5 inches

by.row

Logical value to define whether the plots should be arranged by row. By default TRUE.

print.multiplot

Logical value to define whether to print the multiplot once generated. By default FALSE.

#### Details

To know more about the deepTools's function computeMatrix see the package manual at the following link:

https://deeptools.readthedocs.io/en/develop/content/tools/computeMatrix.html.

#### Value

The functions returns a list containing:

- data.table with the computed values used for the plot;
- metadata table with the information obtained from the matrix\_file.gz;
- plot.list with a plot for each list element;
- density.profile with the density profile of the mean signal generated by plot.density.profile corresponding to the regions/samples for which the summary multiplot have been generated:
- multiplot with the image of all the plots together;
- summary.plot.samples with a plot showing the scores of all regions per each sample;

pStars

- summary.plot.regions with a plot showing the scores of all samples per each region;
- means.comparisons table with the statistical means comparisons (when show.stat.multiplot = TRUE, otherwise a string is returned).

pStars

 $P\text{-}value\ significance\ stars\ definer.$ 

# Description

Converts a p-value score in equivalent stars of significance.

# Usage

```
pStars(p.value, one = 0.05, two = 0.01, three = 0.001, four = 1e-04)
```

# Arguments

p.value	A single numeric value indicating the p-value to evaluate.
one	A numeric value to define the p-value threshold for the first level of significance (*). By default 0.05.
two	A numeric value to define the p-value threshold for the second level of significance (**). By default 0.01.
three	A numeric value to define the p-value threshold for the third level of significance (***). By default $0.001$ .
four	A numeric value to define the p-value threshold for the fourth level of significance (****). By default 0.0001.

# Value

It returns a string with the corresponding level of significance: NS, \*, \*\*, \*\*\*.

# Examples

```
significance = pStars(0.002)
require(dplyr)
data.frame =
   data.frame %>%
   mutate(p.stars = sapply(data.frame$p.value.column, pStars))
```

read.computeMatrix.file

computeMatrix \*.gz file reader

# Description

The function reads a matrix.file.gz generated by deepTools/computeMatrix function or by computeMatrix.deeptools. The value can be passed to plot.density.profile function.

# Usage

```
read.computeMatrix.file(matrix.file)
```

# Arguments

matrix.file

A string indicating indicating the full path to the matrix.file.gz generated by deepTools/computeMatrix function or by computeMatrix.deeptools.

### Value

The functions returns a named list containing:

- metadata data.frame with the information gotten from the matrix\_file.gz;
- matrix.data data.frame with the scores gotten from;
- original.file.path with full path to the original matrix\_file.gz.

This list can be passed as it is to the function plot.density.profile.

restore\_packages

Restores packages installed from a .rda file.

# Description

Installs the packages contained in a .rda file. This file can be generated by the store\_packages function of this package.

### Usage

```
restore_packages(rda_file)
```

#### Arguments

rda\_file

Path to the .rda from which get the information for the packages to reinstall.

#### Value

If it was not possible to re-install al packages, the list of not restored packages will be returned.

44 restriction.sites.to.bed

```
restriction.sites.to.bed
```

Generator of a bed file for enzymatic restriction sites.

#### Description

The function allows to create a bed file that can be added on IGV both as regions and track. It will show the restriction sites of a sequences if starting from the cut positions depending on sequence length. Chromosome, start and end of the input sequence are required.

#### Usage

```
restriction.sites.to.bed(
   cut_positions,
   chromosome,
   genome_start,
   return_bed = TRUE,
   export_bed_file = FALSE,
   output_file_name = paste(getwd(), "restriction_positions.bed", sep = "/"),
   enzyme_cut_length = 4,
   include_region_description = TRUE,
   region_name = "site",
   append = FALSE
)
```

# Arguments

cut\_positions A numeric vector with the list of the restriction/cut positions.

chromosome Chromosome number of the region analyzed.

genome\_start Start position on the genome of the region analyzed.

return\_bed Logic value to define if to return the bed as data.frame. By default TRUE. export\_bed\_file Logic value to define if to export the resulting .bed file. By default FALSE.

output\_file\_name

String corresponding to the path to the exported .bed file. By default "<working.directory>/restriction\_positions.bed".

enzyme\_cut\_length

Numeric value to define the length of cut of the restriction enzyme. By default 4.

include\_region\_description

Logic value to define whether to include a fourth column containing the region name define by the parameter region\_description. By default

region\_name Regions base name. Automatically it will be added a number to the base

name. By default "site", the resulting regions will be: site\_1, site\_2, ....

append Logic value to define if to append the result to the file. By default FALSE,

the file will be overwritten.

sort.bed 45

### **Details**

To map the positions of restriction enzymes it is possible to use <a href="http://restrictionmapper.org/">http://restrictionmapper.org/</a> with the option Map (version 3).

#### Value

If required, it will be returned a classic bed file (chr start end [name]) with the regions centered on the cut position in the genome.

# Examples

sort.bed

Sorter function for .bed files.

### Description

Sorts .bed files by chromosome and position.

# Usage

```
## S3 method for class 'bed'
sort(
  bed,
  bed.header = F,
  sep = "\t",
  return.bed = T,
  export.bed = F,
  export.file.name = paste(getwd(), "sorted.bed", sep = "/"),
  export.header = F
)
```

# Arguments

bed Two options are possible:

- String with the path to a .bed file;

- Data frame corresponding to a bed file format (all the columns and their

names will be kept).

bed.header Logic value to define whether the .bed file contains an header or not. By

default FALSE.

sep String containing the separator character for a .bed file. By default "\t".

46 store\_packages

return.bed Logic value to define if to return the bed as a data.frame. By default

TRUE. Only unique rows are kept.

export.bed Logic value to define if to export the bed file. By default FALSE. Only

unique rows are kept.

export.file.name

String to define the path to the file to be exported, if required. By default

"<working.directory>/sorted.bed".

export.header Logic value to define whether the header should be exported in the sorted

bed file. By default FALSE.

#### **Details**

The function keeps only unique rows.

To get more information about the bed file format see the following page:

https://genome.ucsc.edu/FAQ/FAQformat.html#format1.

#### Value

If required, returns a data frame corresponding to the sorted .bed file.

store\_packages

Stores the information of installed packages in a .rda file.

# Description

Saves the list of all the installed packages in a .rda file. This file can be used to restore the packages from a computer to another or after installation of a new R version by the function restore\_packages of this package.

# Usage

```
store_packages(output_directory = getwd())
```

# Arguments

output\_directory

Path to the directory in which export the .rda file. By default <working.directory>.

#### Value

Nothing is returned. An .rda file will be exported at the output\_directory indicated.

substract.bw 47

substract.bw

Combination of two or more list in a unique one.

# Description

Combines two or more lists in a single one keeping the elements names

# Usage

```
substract.bw(bw1, bw2, return.substracted.bw = T, substracted.bw.file = NULL)
```

# Arguments

bw1 Full path to the first bigWig (the second one will be substracted to this

one).

bw2 Full path to the second bigWig (it will be substracted to the first one).

return.substracted.bw

Logic value to define whether return the resulting bigWig as GRanges

object. By default TRUE.

substracted.bw.file

String for the path of the resulting bigwig file to be exported.

By default NULL, any file will be exported.

### Value

If required a subtraction bigWig is returned as GRanges object. The resulting bigWig can be also directly exported.

uniform.x.axis

Plot X-axis uniforming

# Description

Takes a list of ggplot2 plots, compares their X-axis ranges and applies the highest/lowest limits to each plot in order to uniform all the plots. It can be used also to set the ticks step (to just change the breaks set all parameters as FALSE).

# Usage

```
uniform.x.axis(
  plot.list,
  x.min = TRUE,
  x.max = TRUE,
  ticks.each = NULL,
  digits = 1
)
```

48 uniform.y.axis

# Arguments

plot.list	A single plot or a list of plots.
x.min	Either a logical value to define whether uniform the lower limit or a numeric value defining the lower limit. By default TRUE.
x.max	Either a logical value to define whether uniform the upper limit or a numeric value defining the upper limit. By default TRUE.
ticks.each	Numeric value to define every how much should be placed a tick. By default NULL, ticks will be placed automatically.
digits	A single integer indicating the maximum number of digits required for the rounding of the axis values. By default 1.

### Value

Returns a plot list (or a single plot when only one input plot is provided) equivalent to the input list provided by the user in which the X-axis of all the plots will be uniformed.

uniform.y.axis

Plot Y-axis uniforming

# Description

Takes a list of ggplot2 plots, compares their Y-axis ranges and applies the highest/lowest limits to each plot in order to uniform all the plots. It can be used also to set the ticks step (to just change the breaks set all parameters as FALSE).

# Usage

```
uniform.y.axis(
  plot.list,
  y.min = TRUE,
  y.max = TRUE,
  ticks.each = NULL,
  digits = 1
)
```

### Arguments

plot.list	A single plot or a list of plots.
y.min	Either a logical value to define whether uniform the lower limit or a numeric value defining the lower limit. By default TRUE.
y.max	Either a logical value to define whether uniform the upper limit or a numeric value defining the upper limit. By default TRUE.
ticks.each	Numeric value to define every how much should be placed a tick. By default NULL, ticks will be placed automatically.
digits	A single integer indicating the maximum number of digits required for the rounding of the axis values. By default 1.

update\_pkgs 49

### Value

Returns a plot list (or a single plot when only one input plot is provided) equivalent to the input list provided by the user in which the Y-axis of all the plots will be uniformed.

update\_pkgs

function to automatically update the R packages.

# Description

Automatically updates the R packages from CRAN and BioConductor repositories.

# Usage

```
update_pkgs(ask = FALSE)
```

# Arguments

ask

Logical indicating whether to ask the user to select packages before they are downloaded and installed, or the character string "graphics", which brings up a widget to allow the user to (de-)select from the list of packages which could be updated. (The latter value only works on systems with a GUI version of select.list, and is otherwise equivalent to ask = TRUE). By default FALSE.

# Value

Nothing. The packages will be updated.

# Examples

update\_pkgs()

volcano

Volcano plot generator for RNA-seq data.

# Description

Generates a volcano plot in order to visualize the differentially expressed genes. The plot is highly customizable.

50 volcano

### Usage

```
volcano(
  log2FC_data,
  padj_data,
 FC_t = 1.5,
  p_t = 0.05
 FC_unresponsive_rigth = 1.1,
  FC_unresponsive_left = 1/FC_unresponsive_rigth,
  x_{ends} = NULL,
 y_min = 0,
  y_max = NULL,
  left_label = "UP",
  right_label = "DOWN",
  unresponsive_label = "NoResp",
  null_label = "NULL",
  names = as.character(c(1:length(log2FC_data))),
  left_names = FALSE,
  right_names = FALSE,
  padding = FALSE,
  names_size = 10,
 print_plot = F,
  left_color = "#00BA38",
  right_color = "#F8766D",
  unresponsive_color = "#00A5CF",
  null_color = "gray30",
  point_size = 0.5,
  legend = TRUE,
  legend_title = "Expression status",
  x_label = bquote("log"["2"] * "(Fold Change expression)"),
 y_label = bquote("-log"["10"] * "(p-value"["adjusted"] * ")"),
  title = "Volcano plot",
  sub_title = NULL,
  add_threshold_lines = T,
  threshold_line_color = "gray70",
  threshold_line_type = "dotted",
  font_family = "Helvetica",
  font_size = 12
)
```

### Arguments

log2FC_data	Numeric vector containing the log2(FoldChange) values of each gene.
padj_data	Numeric vector of p-values. Use of adjusted p-values is recommended.
FC_t	Value of the threshold to use for the fold change expression to define differentially expressed genes, expressed as linear value. By default $1.5$ and by consequence $1/1.5$ .
p_t	Value of the threshold to use for the p-values to define differentially expressed genes, expressed as linear value. By default 0.05.

volcano 51

#### FC\_unresponsive\_rigth

Value of the threshold to use for the fold change expression to define unresponsive genes when FC > 1, expressed as linear value. By default 1.1. If NULL it will be calculated symmetrically from FC\_NoResp\_left as 1/FC\_NoResp\_left.

#### FC\_unresponsive\_left

Value of the threshold to use for the fold change expression to define unresponsive genes when FC < 1, expressed as linear value. By default 1/FC\_unresponsive\_rigth. If NULL it will be calculated symmetrically from FC\_NoResp\_rigth as 1/FC\_NoResp\_rigth.

x\_ends Numeric positive value to define manually the range of the X-axis: it will be calculated as c(-x\_ends, x\_ends), for this reason the plot will be symmetrical. By default NULL, the range is assigned automatically and the plot can be asymmetrical.

Numeric value for the minimum value of the Y-axis. By default 0. Set it y\_min to NULL for automatic computation.

Numeric value for the maximum value of the Y-axis. By default NULL. y\_max

left\_label String to indicate the label to use for the set of genes in the left side of the graph (those with FoldChange < 1/FC\_t and p.value < p\_t. By default "UP".

right\_label String to indicate the label to use for the set of genes in the right side of the graph (those with FoldChange > FC\_t and p.value < p\_t. By default "DOWN".

#### unresponsive\_label

String to indicate the label to use for the set of unresponsive genes (those with FC\_unresponsive\_left < FoldChange < FC\_unresponsive\_rigth and  $p.value > p_t$ . By default "NoResp".

null\_label String to indicate the label to use for the set of null genes (those with 1/FC\_t < FoldChange < FC\_t and p.value < p\_t. By default "NULL".

String vector with the names to be plotted if required, eg. gene names. names By default as.character(c(1:length(log2FC\_data))).

left\_names Logic value to indicate if to print the set of differentially expressed genes in the left side of the graph (those with FoldChange < 1/FC\_t and p.value  $< p_t$ . By default FALSE.

right\_names Logic value to indicate if to print the set of differentially expressed genes in the right side of the graph (those with FoldChange > FC\_t and p.value < p\_t. By default FALSE.

padding Logic value to indicate if to plot the padding around the names of genes. By default FALSE.

Numeric value to define de size of the point names size. By default 10. names\_size

print\_plot Logic value to define whether to print the volcano plot once created. By default FALSE.

> String to indicate the color to use for the set of genes in the left side of the graph (those with FoldChange  $< 1/FC_t$  and p.value  $< p_t$ . By default "#00BA38", a green.

left\_color

52 volcano

String to indicate the color to use for the set of genes in the right side of right\_color the graph (those with FoldChange  $> FC_t$  and p.value  $< p_t$ . By default

"#F8766D", a pink/red.

unresponsive\_color

String to indicate the color to use for the set of unresponsive genes (those with FC\_unresponsive\_left < FoldChange < FC\_unresponsive\_rigth and

p.value > p\_t. By default "#00A5CF", a light blue.

String to indicate the color to use for the set of null genes (those with null\_color

1/FC\_t < FoldChange < FC\_t and p.value < p\_t. By default "gray30", a

dark gray.

point\_size Numeric value to define de size of the points. By default 0.5.

legend Logic value to define if to print the legend. By default TRUE.

 ${\tt legend\_title}$ A string to indicate the label of the legend title. By default "Expression

status".

 $x_label$ A string to indicate the X-axis label. By default "log2(fold change

expression)".

A string to indicate the Y-axis label. By default "-log10(p-value adjusted)". y\_label

A string to indicate the title of the plot. By default "Volcano plot". title

sub\_title A string to indicate the subtitle of the plot. By default NULL, no subtitle

is written.

add\_threshold\_lines

Logic value to define if lines for the thresholds, both FC and p.value,

should be plotted. By default TRUE.

threshold\_line\_color

String to define the color of the threshold lines. By default "gray70"

threshold\_line\_type

String or numeric value to define the threshold lines type. Both numeric

and string standard R codes are accepted. By default "dotted", equiva-

font\_family String to define the font family to use in the plot writings. By default

"Helvetica".

font\_size Numeric value to define the font size. By default 12.

# Value

A plot in ggplot2 format.
